Uniform (but not almost) linear acceleration means that objects' spatial dimensions and velocity components in that direction change linearly with time (or time squared).

Example 1:

The path of a ball on an inclined plane is affected by the slope so that its vertical displacement is not the same as its horizontal displacement.

Example 2:

The velocity of a car moving is affected by the slope of the road so that its vertical displacement is not the same as its horizontal displacement.

Example 3:

The velocity of a person moving is affected by the slope of the path so that its vertical displacement is not the same as its horizontal displacement.

$$v_x = v_y = v$$

From v_x and v_y components, find the _____
and it is the vector showing the _____

Notes

The perpendicular velocity vector is still a _____
The perpendicular velocity vector is still perpendicular to the _____

1. In example 1 (above), suppose the ball is moving (a) at a constant velocity and (b) at a constant acceleration. How does the path change?

Find the vertical displacement, and the length of the path between the start and end points.
