Research Handbook on the Law of Artificial Intelligence Woodrow Barfield, Ugo Pagallo, 2018-12-28 The field of artificial intelligence AI has made tremendous advances in the last two decades but as smart as AI is now it is getting smarter and becoming more autonomous This raises a host of challenges to current legal doctrine including whether AI algorithms should count as speech whether AI should be regulated under antitrust and criminal law statutes and whether AI should be considered as an agent under agency law or be held responsible for injuries under tort law This book contains chapters from US and international law scholars on the role of law in an age of increasingly smart AI addressing these and other issues that are critical to the evolution of the field **Handbook of Geometric Computing** Eduardo Bayro Corrochano, 2005-12-06

Many computer scientists engineers applied mathematicians and physicists use geometry theory and geometric computing methods in the design of perception action systems intelligent autonomous systems and man machine interfaces This handbook brings together the most recent advances in the application of geometric computing for building such systems with contributions from leading experts in the important fields of neuroscience neural networks image processing pattern recognition computer vision uncertainty in geometric computations conformal computational geometry computer graphics and visualization medical imagery geometry and robotics and reaching and motion planning For the first time the various methods are presented in a comprehensive unified manner This handbook is highly recommended for postgraduate students and researchers working on applications such as automated learning geometric and fuzzy reasoning human like artificial vision tele operation space maneuvering haptics rescue robots man machine interfaces tele immersion computer and robotics

Smart Engineering Systems Cihan H. Dagli, 1997 Proceedings of the Artificial Neural Networks in Engineering Conference November 9-12 1997 St Louis Missouri The papers compiled in this book focus on building smart components to engineering systems currently available The term smart in this context indicates physical systems that can interact with their environment and adapt to changes in both space and time by their ability to manipulate the environment through self awareness and perceived models of the world based on both quantitative and qualitative information Recent technologies such as artificial neural networks fuzzy logic evolutionary programming data mining wavelets complex systems and virtual reality form the basis of Smart Engineering System Design In 1997 the Department of Engineering Management at the University of Missouri Rolla organized the ANNIE 97 conference to advance the techniques of Smart Engineering System Design in collaboration with the IEEE Neural Network Council This was the seventh meeting held in St Louis Missouri U S A since the founding of the conference in 1991 The conference attracted over 162 papers from 20 countries which after being peer reviewed and revised have been included in this book **Robust Control of Linear Systems and Nonlinear Control**

M. A. Kaashoek, J. H. van Schuppen, A. C. M. Ran, 1990 This volume is the second of the three volume publication containing the proceedings of the 1989 International Symposium on the Mathematical Theory of Networks and Systems MTNS 89 which was held in Amsterdam The Netherlands June 19-23 1989 The International Symposia MTNS focus attention on problems from system and control theory circuit theory and signal processing which in general require application of sophisticated mathematical tools such as from function and operator theory linear algebra and matrix theory differential and algebraic geometry The interaction between advanced mathematical methods and practical engineering problems of circuits systems and control which is typical for MTNS turns out to be most effective and is as these proceedings show a continuing source of exciting advances The second volume contains invited papers and a large selection of other symposium presentations in the vast area of robust and nonlinear control Modern developments in robust control and H_∞ theory for finite as well as for infinite dimensional systems are presented A large part of the volume is devoted to nonlinear control Special attention is paid to problems in robotics Also the general theory of nonlinear and infinite dimensional systems is discussed A couple of papers deal with problems of stochastic control and filtering vi Preface The titles of the two other volumes are Realization and Modelling in System Theory volume 1 and Signal Processing Scattering and Operator Theory and Numerical Methods volume 3 **Core List of Books and Journals in Science and Technology** Russell H.

Computational Kinematics J. Angeles, Günter Hommel, Peter Kovács, 2013-06-29 The aim of this book is to provide an account of the state of the art in Computational Kinematics We understand here under this term that branch of kinematics

research involving intensive computations not only of the numerical type but also of a symbolic nature Research in kinematics over the last decade has been remarkably oriented towards the computational aspects of kinematics problems In fact this work has been prompted by the need to answer fundamental questions such as the number of solutions whether real or complex that a given problem can admit Problems of this kind occur frequently in the analysis and synthesis of kinematic chains when finite displacements are considered The associated models that are derived from kinematic relations known as closure equations lead to systems of nonlinear algebraic equations in the variables or parameters sought What we mean by algebraic equations here is equations whereby the unknowns are numbers as opposed to differential equations where the unknowns are functions The algebraic equations at hand can take on the form of multivariate polynomials or may involve trigonometric functions of unknown angles Because of the nonlinear nature of the underlying kinematic models purely numerical methods turn out to be too restrictive for they involve iterative procedures whose convergence cannot in general be guaranteed Additionally when these methods converge they do so to only isolated solutions and the question as to the number of solutions to expect still remains
