Kidney Dissection Lab

In this lab activity fresh pig kidneys will be dissected. Hygiene is crucial when dealing with fresh specimens. Vinyl gloves will be provided and hand washing with soap and warm water must be performed before leaving the class.

Evaluation

You will be evaluated based on the following criteria:

1. **Respect** for the specimen you are studying. If you treat the specimen in a disrespectful way, you will be removed from the lab and assigned a mark of 0.
2. **Safety**. Your lab coats should be cleaned, dried and returned at the end of the class. Your group is solely responsible for your scalpel. Show your equipment to the teacher before returning it to the cart. Always wash your hands and your work area when you are finished. Handle dissecting tools carefully (don't cut directly towards yourself or your lab partner(s)). You should wear gloves and safety goggles. Lab aprons are available if you choose to use them.
3. **Participation**. Every member of your team should contribute to learning from the dissection.
4. **Careful dissections**. Try to follow all directions to the best of your ability, and to cut carefully in order to observe other organs. Use your reference materials and/or the teacher to assist you.
5. **Disposal**. Any tissues removed should be placed in a special garbage bag, not down the sink or in the regular garbage.
6. **Checkup questions**. At the end of the activity, the teacher will have questions to ask you about the actual dissection (eg. Where is the renal capsule? What is this dark red mass?) Each person in your group will have to answer one or more questions. Call the teacher over by raising your hand when your group is ready for the questions.
* It is YOUR GROUP'S RESPONSIBILITY to ensure that you get a chance to answer these questions before your disposal of your specimens!
7. **Lab report**. For this activity, the report will consist only of biological drawings and answers to questions in this handbook. Each student will hand in their own report.

Background Information

The human urinary system consists of two kidneys, two ureters, one urinary bladder, and one urethra. This system has two basic functions, both of which occur in the kidneys. The first function is to remove nitrogenous wastes (such as creatine, urea, and uric acid) from the body. The second function is to maintain the ion, pH, and water levels in the blood. One product of these processes is urine, a pale yellow fluid containing water, and particles such as urea, sodium, potassium, creatine, and uric acid. Urine moves from the kidneys to the urinary bladder via the ureters, which are essentially tube-shaped extensions of the renal pelvis. Urine is stored in the urinary bladder until it leaves the body via the urethra.
