Villani, 2025-08-28 How life can emerge in a lifeless environment is one of the major open scientific challenges This book pays particular attention to self organization phenomena that might have led to the appearance of the first protocells i e cell like structures much simpler than present day cells endowed with some primitive kinds of metabolism and heredity After a brief description of the known facts and main hypotheses mathematical and computational models of protocells are discussed they should complement laboratory experiments allowing rapid explorations of the dynamical properties of several alternative types of protocell architectures Given the great uncertainties about the actual origin of life it seems impossible to provide a detailed and complete reconstruction of the first life forms It is therefore necessary to identify plausible pathways highlighting the main physical and chemical processes towards life that can take place Generic models which are abstract enough to encompass different specific hypotheses are particularly relevant as they allow one to identify properties which are common to several different detailed scenarios They are widely discussed and a particular case is described in detail

namely that of synchronization between the rate of molecular replication and that of reproduction of the whole protocell which is a necessary condition for sustainable growth of a population and a prerequisite for further evolution Using generic models it is shown that such synchronization spontaneously emerges in successive generations under very general assumptions The book also contains extensive descriptions of the emergence of long polymers of autocatalytic sets and of the interactions between protocells and their environments The book is not meant only for specialists but also for scientists working in different fields as well as for laymen with an interest in science It requires a basic knowledge of chemistry and biology and an interest in simulation models
