as a pioneering step towards understanding visual perception. In his view, human vision was based on a complete surface reconstruction of the environment that was then used to address visual subtasks. This approach was proven to be insufficient by neurobiologists, and complementary ideas from statistical pattern recognition and artificial intelligence were introduced to better address the visual perception problem. In this framework, visual perception is represented by a set of actions and rules connecting these actions. The emerging concept of active vision consists of a selective visual perception paradigm that is basically equivalent to recovering from the environment the minimal piece of information required to address a particular task of interest.
