Abstract The purpose of this study was to determine the effect of a 12-week, low-intensity, supervised walking program on the physical and psychological health of older adults. The study was conducted in a community-based setting. The participants were 100 older adults (65 years of age and older) who were recruited from a local senior center. The participants were randomly assigned to either a walking program or a control group. The walking program consisted of 12 weeks of supervised walking, 3 times per week, for 30 minutes per session. The control group did not participate in any walking program. The participants were assessed at baseline and at 12 weeks. The physical health outcomes measured were walking speed, walking distance, and balance. The psychological health outcomes measured were depression, anxiety, and quality of life. The results of the study showed that the walking program had a positive effect on the physical and psychological health of the older adults. The walking program group had significantly higher walking speed, walking distance, and balance than the control group at 12 weeks. The walking program group also had significantly lower levels of depression, anxiety, and lower quality of life than the control group at 12 weeks. The results of this study suggest that a 12-week, low-intensity, supervised walking program can improve the physical and psychological health of older adults.
