Background

The Brain

The brain is the control center of the body and is housed within the protective hard skull, layers of tissue called meninges, and cerebrospinal fluid. The male adult brain weighs approximately 1400 g, while the female adult brain is approximately 1300 g, with a consistency similar to tofu. As we age, we lose more than a gram of brain tissue each year. The brain uses 20% of the oxygen and 25% of the glucose in our bodies. The brain is not fully developed until 16-17 years old with dramatic changes in the front lobes occurring through puberty. This is an

important area for decision-making and judgment. Perhaps the next time your parents are mad at you for poor decision-making, you may try to blame it on your underdeveloped brain!

The brain has neurons arranged into either white or grey matter. White matter is only made up of the axon portion of the neuron and relays messages from different portions of the grey matter. Grey matter is made up of the cell bodies of the neurons and is capable of storing and receiving nerve impulses from the body and other parts of the brain. The brain has different regions that are responsible for different functions. There are three principle parts:

- **Cerebrum** – this makes up most of the brain and is divided into a left and right hemisphere. The cerebrum functions in learning, speech, emotion, reasoning, vision, hearing, touch, and fine movements. The surface of the cerebrum is called the cortex and is covered with grey matter arranged in folds. A fold in the brain is called a gyrus, and lines in between the folds are called the sulcus. This folding increases the overall surface area of the brain, providing more space for neurons.
- **Cerebellum** – Located under the cerebrum, the cerebellum maintains posture, balance, and is responsible for movement.
- **Brainstem** – Located at the base of the cerebrum and just anterior to the cerebellum. The brain stem is made up of the medulla, midbrain, and pons, which are responsible for maintaining important functions of the body including respiration, circulation, body temperature, sleep, digestion, and swallowing.

Each of these parts of the brain are broken up into smaller areas based on the function they perform. For example, the cerebrum is broken up into several lobes. The figure to the right identifies some of these lobes. The inner brain houses important endocrine glands and structures.

The Major Portions of the Brain Include the Cerebrum, Cerebellum and Brain Stem
