

Geomorphology: Grade 11 Geography Summary

Geomorphology is the study of landforms, their processes, forms, and the landscapes they create. It involves understanding how natural forces shape the Earth's surface and change it over time.

1. Internal and External Earth Processes

- **Internal Processes (Endogenic Forces)**: These originate from within the Earth and shape landforms through tectonic activities.
 - **Tectonic Movements**: Include earthquakes, volcanic activity, and mountain building.
 - **Folding and Faulting**: Caused by tectonic forces; folding creates ridges and valleys, while faulting leads to fractures and displacement of rock layers.
- **External Processes (Exogenic Forces)**: Involve weathering, erosion, and deposition, driven by forces like water, wind, ice, and gravity.
 - **Weathering**: The breakdown of rocks at the Earth's surface into smaller particles, which can be physical, chemical, or biological.
 - **Erosion and Deposition**: Erosion transports weathered materials, while deposition occurs when these materials settle and accumulate.

2. Types of Landforms

- **Mountains**: Created by tectonic forces like folding, faulting, and volcanic activity.
- **Plateaus**: Elevated flat areas formed by uplift or lava flow.
- **Plains**: Large, flat areas resulting from sediment deposition over time.
