Fundamental Networking in Java Esmond Pitt, 2006-02-28 The book provides complete coverage of fundamental IP networking in Java. It introduces the concepts behind TCP/IP and UDP and their intended use and purpose, gives complete coverage of Java networking APIs, includes an extended discussion of advanced server design so that the various design principles and tradeoffs concerned are discussed, and equips the reader with analytic queuing theory tools to evaluate design alternatives. It covers UDP multicasting and covers multi-homed hosts, leading the reader to understand the extra programming steps and design considerations required in such environments. After reading this book, the reader will have an advanced knowledge of fundamental network design and programming concepts in the Java language, enabling them to design and implement distributed applications with advanced features and to predict their performance. Special emphasis is given to the scalable I/O facilities of Java 1.4 as well as complete treatments of multi-homing and UDP, both unicast and multicast.

Java Vs. .NET Security

Denis Pilipchuk,Denis Piliptchouk,2004-05-27 This document reviews security features of two most popular modern development platforms Java and NET Java v1 4 2 J2EE v1 4 and NET v1 1 The platform choice is not random because they represent to a certain extent competition between UNIX like and Windows systems which largely defined software evolution over the last decade Although Java applications run on Windows and there exist UNIX bridges for NET the Java UNIX and NET Windows combinations are used for development of a significant portion if not majority of applications on their respective operating systems so both platforms deserve a careful examination of their capabilities Such an examination is especially important since different aspects of UNIX Windows and Java NET competition have been flaming endless heated debates between proponents of both camps which often blindly deny merits of the opposite side while at the same time praising their preferred solution The material here is purposely structured by general categories of protection mechanism and reviewing each platform B G Bs features in those areas This allows starting each topic with a platform neutral security concept and performing relatively deep drill downs for each technology without losing track of the overall focus of providing an unbiased side by side comparison The document is based on the research material that was used as a foundation of the feature article Securing NET and Enterprise Java Side by Side which was written by Vincent Dovydaitis and myself and appeared in Numbers 3 4 of Computer Security Journal in 2002 The following areas will be considered Security Configuration and Code Containment Cryptography and Communication Code Protection and Code Access Security or CAS Authentication and User Access Security or UAS
