

## PSY 2301 Exam 1 Study Guide

### Chapter 1: Introduction to Statistics

1. What is the difference between a population and a sample?  
\_Population\_: the large group of all possible scores that would be obtained if the behavior of every individual of interest in a particular situation could be measured. Examples: All American citizens, All females, All patients with chronic pain, All college freshmen, etc.  
A \_Sample\_ is a relatively small subset of a population intended to represent, or stand for, the population
2. What do parameter and statistic refer to? And when do we use each term?  
A \_Statistic\_ is a number describing an aspect of the scores in a sample.  
A \_Parameter\_ is a number describing an aspect of the scores in the population.
3. How do correlational studies differ from experimental studies?  
In an \_Experimental\_, the researcher actively changes or manipulates one variable and then measures participants' scores on another variable to see if a relationship is produced.  
In a \_Correlational\_ the researcher measures participants' scores on two variables and then determines whether a relationship is present.
4. Describe the Independent and Dependent variables in an experiment.  
The \_Independent\_ is changed or manipulated by the experimenter.  
The \_Dependent\_ is the variable measuring a behavior or attribute of participants we expect will be influenced by the independent variable.
5. What do we call the levels or groups within the Independent Variable?  
A \_Condition/levels\_ is a specific amount or category of the independent variable creating the specific situation under which participants are studied
