

## Le réglage de la fréquence

Les centrales doivent à tout instant **produire la quantité d'électricité nécessaire à l'alimentation de la consommation**. Pour répondre à cet impératif, les centrales de France et d'Europe sont interconnectées grâce au maillage du réseau de transport, et peuvent se secourir mutuellement en cas de panne. Pour que le réseau interconnecté fonctionne, il existe **une obligation commune** à toutes les centrales : leurs alternateurs doivent tourner à la même vitesse électrique, afin de **produire une tension de fréquence uniforme** dans tout le réseau européen. C'est ce qu'on appelle le **synchronisme** des alternateurs.

### Qu'est-ce que la fréquence ?

La fréquence correspond au nombre de cycles que fait le courant alternatif en une seconde (voir chapitre 2). Pour un alternateur, elle correspond au nombre de tours que fait l'arbre de la turbine en une seconde, multiplié par le nombre d'électro-aimants placés dans le rotor.

A la différence de la tension, qui est un paramètre local (la tension est différente en tout point du réseau, elle dépend du courant qui circule dans les lignes au voisinage du point considéré), **la fréquence est homogène dans tout le réseau électrique** dès lors que la production et la consommation sont en équilibre.

### Le maintien de la fréquence

La fréquence doit être maintenue autour de la valeur nominale de **50 Hz**, quelles que soient les variations de consommation ou de production. En effet, d'une part, une fréquence évoluant sans cesse rendrait l'électricité inutilisable pour de multiples usages, d'autre part, la plupart des composants du système électrique sont conçus pour fonctionner dans une plage de fréquence donnée, en dehors de laquelle des dysfonctionnements graves de matériels peuvent apparaître.

### Est-ce que la fréquence peut varier ?

**La fréquence varie en permanence** très légèrement en fonction de la consommation d'électricité et des événements affectant la production. Les écarts de fréquence sont mesurés en millièmes de Hertz. Les systèmes de régulation des centrales corrigent ces variations de fréquence.

### Quels sont les différents types de variations de fréquence ?

On distingue :

- les petites variations globales et aléatoires autour de 50 Hz dues aux évolutions continues de la consommation ;
- les variations globales de fréquence, qui peuvent être provoquées par des variations brutales de production (arrêt inopiné d'une centrale ou avarie sur la ligne de raccordement d'un groupe) ;
- les fortes variations locales de fréquence qui surviennent lors d'incidents de type court-circuit.

### POURQUOI 50 Hz ?

Le choix de la fréquence a été fait il y a plus de 100 ans. Cette fréquence correspond à un optimum technico-économique. Une fréquence plus élevée conduirait à des coûts de transport supérieurs, et une fréquence trop faible risquerait d'être vécue sur les ampoules, que l'œil humain verrait scintiller.
