Euclid Vindicated from Every Blemish Gerolamo Saccheri, 2014-08-07 This first complete English language edition of Euclides vindicatus presents a corrected and revised edition of the classical English translation of Saccheri's text by G B Halsted It is complemented with a historical introduction on the geometrical environment of the time and a detailed commentary that helps to understand the aims and subtleties of the work Euclides vindicatus written by the Jesuit mathematician Gerolamo Saccheri was published in Milan in 1733 In it Saccheri attempted to reform elementary geometry in two important directions a demonstration of the famous Parallel Postulate and the theory of proportions Both topics were of pivotal importance in the mathematics of the time In particular the Parallel Postulate had escaped demonstration since the first attempts at it in the Classical Age and several books on the topic were published in the Early Modern Age At the same time the theory of proportion was the most important mathematical tool of the Galilean School in its pursuit of the mathematization of nature Saccheri's attempt to prove the Parallel Postulate is today considered the most important breakthrough in geometry in the 18th century as he was able to develop for hundreds of pages and dozens of theorems a system in geometry that denied the truth of the postulate in the attempt to find a contradiction This can be regarded as the first system of non Euclidean geometry Its later developments by Lambert Bolyai Lobachevsky and Gauss eventually opened the way to contemporary geometry Occupying a unique position in the literature of mathematical history Euclid Vindicated from Every Blemish will be of high interest to historians of mathematics as well as historians of philosophy interested in the development of non Euclidean geometries

Heaven on Earth L. S. Fauber, 2019-12-03 Before the invention of the telescope people used nothing more than their naked eye to fathom what took place in the visible sky So how did four men in the 1500s though of different nationality age religion and class collaborate to discover that the Earth revolved around the Sun With this radical discovery that went against the Catholic Church they created our contemporary world and with it the uneasy conditions of modern life Heaven on Earth is an intimate examination of a scientific family that of Nicolaus Copernicus Tycho Brahe Johannes Kepler and Galileo Galilei Fauber juxtaposes their work with insight into their personal lives and and political considerations which in turn shaped their pursuit of knowledge Uniquely he shows how their intergenerational collaboration was actually what made the scientific revolution possible Contrary to the competitive nature of research today collaboration was key to early discoveries These men related to one another via intellectual pursuit rather than blood calling each other brothers fathers and sons Filled with rich characters and sweeping history Heaven on Earth reveals how the connection between these pillars of intellectual history moved science forward and helped usher the world into modernity

Foundations for the Future in Mathematics Education Richard A. Lesh, Eric Hamilton, James J. Kaput, 2020-10-07 The central question addressed in Foundations for the Future in Mathematics Education is this What kind of understandings and abilities should be emphasized to decrease mismatches between the narrow band of mathematical understandings and abilities that are emphasized in mathematics classrooms and tests and those that are needed for success beyond school in the 21st century This is an urgent question In fields ranging from aeronautical engineering to agriculture and from biotechnologies to business administration outside advisors to future oriented university programs increasingly emphasize the fact that beyond school the nature of problem solving activities has changed dramatically during the past twenty years as powerful tools for computation conceptualization and communication have led to fundamental changes in the levels and types of mathematical understandings and abilities that are needed for success in such fields For K 12 students and teachers questions about the changing nature of mathematics and mathematical thinking beyond school might be rephrased to ask If the goal is to create a mathematics curriculum that will be adequate to prepare students for informed citizenship as well as preparing them for career opportunities in learning organizations in knowledge economies in an age of increasing globalization how should traditional conceptions of the 3Rs be extended or reconceived Overall this book suggests that it is not enough to simply make incremental changes in the existing curriculum whose traditions developed out of the needs of industrial societies The authors beyond simply stating conclusions from their research use results from it to describe promising directions for a research agenda related to this question The volume is organized in three sections Part I focuses on naturalistic observations aimed at clarifying what kind of mathematical thinking people really do when they are engaged in real life problem solving or decision making situations beyond school Part II shifts attention toward changes that have occurred in kinds of elementary but powerful mathematical concepts topics and tools that have evolved recently and that could replace past notions of basics by providing new foundations for the future This section also initiates discussions about what it means to understand the preceding ideas and abilities Part III extends these discussions about meaning and understanding and emphasizes teaching experiments aimed at investigating how instructional activities can be designed to facilitate the development of the preceding ideas and abilities Foundations for the Future in Mathematics Education is an

Euclid's Heritage. Is Space Three-Dimensional? P. Janich, 2013-03-09 We live in a space we get about in it We also quantify it we think of it as having dimensions Ever since Euclid's ancient geometry we have thought of bodies occupying parts of this space including our own bodies the space of our practical orientations our moving about as having three dimensions Bodies have volume specified by measures of length breadth and height But how do we know that the space we live in has just these three dimensions It is theoretically possible that some spaces might exist that are not correctly described by Euclidean geometry After all there are the non Euclidian geometries descriptions of spaces not conforming to the axioms and theorems of Euclid's geometry As one might expect there is a history of philosophers attempts to prove that space is three dimensional The present volume surveys these attempts from Aristotle through Leibniz and Kant to more recent philosophy As you will learn the historical theories are rife with terminology with language already tainted by the assumed but by no means obvious clarity of terms like dimension line point and others Prior to that language there are actions ways of getting around in the world building things being interested in things in the more specific case of dimensionality cutting things It is to these actions that we must eventually appeal if we are to understand how science is grounded
