Wells,1999 This book provides a practical introduction to the theory and practice of coding and information theory for application in the field of electronic communications It is written at an introductory level and assumes no prior background in coding or information theory While the mathematical level is detailed it is still introductory Through a discussion that balances theory and practical applications and abandons the traditional theorem proof format this valuable book presents an overview of digital communication systems and the concept of information It is written in a easy to follow conversational style that integrates practical engineering issues through formal and conceptual discussions of mathematical issues It also makes extensive use of explicit examples that illustrate methods and theory throughout the book For the professional it provides an essential hands on head start for real world projects and

situations An essential reference for professional engineers in the field of electronic communications      Source and Channel Coding John B. Anderson, Seshadri Mohan, 1991-09-30 oW should coded communication be approached Is it about probability theorems and bounds or about algorithms and structures The traditional course in information theory and coding teaches these together in one course in which the Shannon theory a probabilistic theory of information dominates The theory's predictions and bounds to performance are valuable to the coding engineer but coding today is mostly about structures and algorithms and their size speed and error performance While coding has a theoretical basis it has a practical side as well an engineering side in which costs and benefits matter It is safe to say that most of the recent advances in information theory and coding are in the engineering of coding These thoughts motivate the present text book A coded communication book based on methods and algorithms with information theory in a necessary but supporting role There has been much recent progress in coding both in the theory and the practice and these pages report many new advances Chapter 2 covers traditional source coding but also the coding of real one dimensional sources like speech and new techniques like vector quantization Chapter 4 is a unified treatment of trellis codes beginning with binary convolutional codes and passing to the new trellis modulation codes      **Algorithms and Coding Techniques for Reliable Data Management and Storage** Frederic Sala, 2016 This dissertation studies problems of data management under unreliable conditions how can data be efficiently reconstructed synchronized transmitted and stored in the presence of uncertainty or noise The common underlying thread running through the approaches to these problems is the discipline of coding theory Problems related to data editing and modification are considered in the first part of the dissertation For the combinatorial data reconstruction problem a new result regarding the minimum number of traces needed for exact reconstruction is introduced resolving an open problem Several applications and examples are discussed An efficient and practical protocol relying on building blocks from coding theory is proposed for synchronizing data with general non uniform edits this protocol outperforms existing tools in many scenarios In addition synchronization of data represented by complete or partial ranked lists is studied and novel bounds and code constructions are presented The second part of the dissertation is concerned with problems of efficient and robust data storage Inspired by memories operating in high radiation environments an exploration of non uniform noisy decoding for the popular low density parity check LDPC class of error correcting codes is performed A novel model and density evolution analysis are introduced The problem of comparing representing and classifying practical error control strategies for caches and other on chip memories is tackled by introducing a powerful explanatory theoretical framework Finally a novel coding problem for data used in learning algorithms is considered The insights from this work combining tools from a variety of disciplines including algorithms coding and information theory and combinatorics contribute to a unified approach to general problems of data Given the ongoing data revolution solutions to these problems are of paramount importance      *Error Correction Coding* Todd K.
