

Kidney Dissection

Procedures:

Internal Anatomy:

- Once you have the kidney cross-section, you should notice 2 distinct layers. The outer layer is grainy and has a consistent texture. This is the **renal cortex**.
- Inside the renal cortex is the **renal medulla**, which is a layer composed of triangular-shaped structures known as the **renal pyramids**. The nephrons are found between the renal cortex and the renal medulla, extending into both layers. You won't be able to see the nephrons during the dissection, but their location is important for understanding the functions of the kidney.
- After the nephrons have filtered the blood, the remaining water and waste products are produced as urine within the renal pyramids. This urine is passed to the **minor calyces** (singular: calyx), which begin at the tip of each renal pyramid. These tips are called **renal papillae**. Like small streams converging into a larger river, the minor calyces converge into **major calyces**, which converge into the **renal pelvis**.
- At the renal pelvis, the urine is passed into the **ureter** to be carried on to the bladder.
- Use the diagrams provided to find and identify the structures listed on the dissection chart. Give each structure a number and use dissecting pins to pin and label each structure listed. Use this lab, a textbook, or a computer to find the function/description of each structure.
- Answer the questions at the bottom of the chart and have your structures checked by your instructor.
