book is primarily intended for use in undergraduate courses in any discipline and also for a substantial portion of postgraduate courses that include the subject of operating systems It can also be used for self study Key Features Exhaustive discussions on traditional uniprocessor based generic operating systems with figures tables and also real life implementations of Windows UNIX Linux and to some extent Sun Solaris Separate chapter on security and protection a grand challenge in the domain of today s operating systems describing many different issues including implementation in modern operating systems like UNIX Linux and Windows Separate chapter on advanced operating systems detailing major design issues and salient features of multiple processor based operating systems including distributed operating systems Cluster architecture a low cost base substitute for true distributed systems is explained including its classification merits and drawbacks Separate chapter on real time operating systems containing fundamental topics useful concepts and major issues as well as a few different types of real life implementations Online Support Material is provided to negotiate acute page constraint which is exclusively a part and parcel of the text delivered in this book containing the chapter wise topic wise detail explanation with representative figures of many important areas for the completeness of the narratives   Operating System M. Naghibzadeh,2005 Operating System is the most essential program of all without which it becomes cumbersome to work with a computer It is the interface between the hardware and computer users making the computer a pleasant device to use The Operating System Concepts and Techniques clearly defines and explains the concepts process responsibility creation living and termination thread responsibility creation living and termination multiprogramming multiprocessing scheduling memory management non virtual and virtual inter process communication synchronization busy wait based semaphore based and message based deadlock and starvation Real life techniques presented are based on UNIX Linux and contemporary Windows The book has briefly discussed agent based operating systems macro kernel microkernel extensible kernels distributed and real time operating systems The book is for everyone who is using a computer but is still not at ease with the way the operating system manages programs and available resources in order to perform requests correctly and speedily High school and university students will benefit the most as they are the ones who turn to computers for all sorts of activities including email Internet chat education programming research playing games etc It is especially beneficial for university students of Information Technology Computer Science and Engineering Compared to other university textbooks on similar subjects this book is downsized by eliminating lengthy discussions on subjects that only have historical value
