

## Inferring species Phylogenetic Trees

Phylogenetic trees represent evolutionary relationships among taxa. They are inferred from data using a variety of methods.

Phylogenetic trees are used to understand the evolutionary history of a group of organisms.

Species: taxonomic units (individuals, populations, species) that are grouped together based on shared characteristics.

### Species & Phylogeny

In molecular phylogenetics, species are defined based on different criteria: different morphological groups, different geographical areas, and different genetic groups. The most common criterion is the biological species concept.

Phylogenetic trees are constructed using data from different species. The data is used to infer the evolutionary relationships between the species.

We build a phylogenetic tree using all the data available and then we can

infer the evolutionary relationships.
