Apart from physical damage component failure is the most common reason why PCBs need repair and rework Component failure may be the result of low quality dislodging or ageing of components A bad PCB layout however is the most common cause Power failure overheated parts and burned components may result from a poor design PCB rework is the process of making changes to or fixing flaws on a printed circuit board after it has already been produced or assembled This may require anything from changing components to cleaning up excess solder to fixing broken traces or pads Circuit board rework is a crucial step in electronics production because it allows manufacturers to address any issues with their final products before they reach the end user In Electronics defects leading to rework may include Poor solder joints because of faulty assembly or thermal cycling Solder bridges unwanted drops of solder that connect points that should be isolated from each other Faulty components Engineering parts changes upgrades etc Components broken due to natural wear physical stress or excessive current Components damaged due to liquid ingress leading to corrosion weak solder joints or physical damage Surface mount technology SMT rework and through hole technology THT rework are the two most common forms of the printed circuit board PCB rework Surface mount technology or SMT refers to small flat components that are soldered directly onto the surface of a printer **Electronics Technician 1 & C** Norman D. East, 1987

Electronics, 1986 **Printed circuit board assembly** P.J.W. Noble, 2013-03-09 Assembly of difficult components onto printed circuit boards is emerging as an important application area for small fast industrial robots For other robot tasks for example paint spraying or arc welding the applications engineer can rely on a body of published information representing decades of accumulated knowledge about the actual process being automated But for the process of assembly relatively little systematically presented knowledge exists mainly because so much manual assembly depends on extremely subtle coordination of hand eye and brain which is hard to represent directly in engineering terms As for the particular processes of electronic assembly they have hardly been covered at all in the literature Yet the design of a good PCB automation system depends crucially on the responsible engineer fully understanding every aspect of the process he or she is automating whether working for the electronics manufacturer an automation company a research laboratory or a machine builder The author of this book has had extensive practical experience in all these roles as a source of great detail on most aspects of the electronic assembly process it will be of unique value not only to the robot specialist but well beyond that to anyone needing to understand how printed circuit boards are manufactured P G Davey Acknowledgements The author is indebted to many companies and individuals from within the pcb assembly industry **Air Force Magazine**, 1984 *Scientific and*
