

Simple microscope

(a)

The simple microscope consists of a single lens which is used to view small objects. The object is placed between the lens and its focal point. The lens forms a virtual, erect, and magnified image of the object. This is the principle of the simple microscope.

The magnification of the simple microscope is given by the ratio of the angle subtended by the image to the angle subtended by the object at the unaided eye. The magnification is always greater than 1.

$M = \frac{\theta'}{\theta} = \frac{v}{u} \left( \frac{D}{v} \right)$

Compound microscope

The compound microscope consists of two lenses, the objective and the eyepiece. The object is placed between the objective lens and its focal point. The objective lens forms a real, inverted, and magnified image of the object. This image is then viewed through the eyepiece lens, which forms a virtual, erect, and further magnified image of the intermediate image.

The magnification of the compound microscope is given by the product of the magnifications of the objective and the eyepiece lenses. The magnification is always greater than 1.

$M = M_o \times M_e$

The magnification of the compound microscope is given by the ratio of the angle subtended by the final image to the angle subtended by the object at the unaided eye. The magnification is always greater than 1.

$M = \frac{\theta'}{\theta} = \frac{v_o}{u_o} \left( \frac{D}{v_e} \right)$

$M = \frac{v_o}{u_o} \left( \frac{D}{v_e} \right)$

Telescope

The telescope consists of two lenses, the objective and the eyepiece. The objective lens has a large diameter and a long focal length. The eyepiece lens has a small diameter and a short focal length. The objective lens forms a real, inverted, and magnified image of the object. This image is then viewed through the eyepiece lens, which forms a virtual, erect, and further magnified image of the intermediate image.

The magnification of the telescope is given by the ratio of the focal length of the objective lens to the focal length of the eyepiece lens. The magnification is always greater than 1.

$M = \frac{f_o}{f_e}$

$M = \frac{f_o}{f_e}$

$M = \frac{f_o}{f_e}$
