Earthquake Geotechnical Engineering Design Michele Maugeri, Claudio Soccodato, 2014-02-03 Pseudo static analysis is still the most used method to assess the stability of geotechnical systems that are exposed to earthquake forces However this method does not provide any information about the deformations and permanent displacements induced by seismic activity Moreover it is questionable to use this approach when geotechnical systems are affected by frequent and rare seismic events Incidentally the peak ground acceleration has increased from 0.2 to 0.3 g in the seventies to the current value of 0.6 to 0.8 g Therefore a shift from the pseudo static approach to performance based analysis is needed Over the past five years considerable progress has been made in Earthquake Geotechnical Engineering Design EGED The most recent advances are presented in this book in 6 parts The evaluation of the site amplification is covered in Part I of the book In Part II the evaluation of the soil foundation stability against natural slope failure and liquefaction is treated In the following 3 Parts of the book the EGED for different geotechnical systems is presented as follows the design of levees and dams including natural slopes in Part III the design of foundations and soil structure interaction analysis in Part IV underground structures in Part V Finally in Part VI new topics like the design of reinforced earth retaining walls and landfills are covered

Probabilistic performance-based seismic design fib Fédération internationale du béton, 2012-05-07 In the last ten to fifteen years a vast amount of research has been undertaken to improve on earlier methods for analysing the seismic reliability of structures These efforts focused on identifying aspects of prominent relevance and disregarding the inessential ones with the goal of producing methods that are both more efficient and easier to use in practice Today this goal can be said to be substantially achieved During these years scientific activity covered all of the many aspects involved in such a multi disciplinary problem ranging from seismology to geotechnics to structural analysis and economy all of them to be consistently organised into a probabilistic framework As the output of this research was dispersed into a multitude of technical papers fib Commission 7 thought it worthwhile to select the essential aspects of this large body of knowledge and to present them into a coherent and accessible document for structural engineers To this end a task group of specialists was formed whose qualifications come from their personal involvement in the above mentioned developments throughout this period of time From its inception the group decided that the bulletin should have had a distinct educational character and provide a clear overview of the methods available The outcome is a compact volume that starts by introducing the concepts and definitions of performance based engineering continues with two chapters on assessment and design respectively presenting the methods in detail accompanied by

illustrative examples and concludes with an appendix with sample programming excerpts for their implementation It is believed that at present fib Bulletin 68 represents a unique compendium on probabilistic performance based seismic design

Quay Walls, Second Edition J.G. de Gijt,M.L. Broeken,2013-12-02 This new edition of the handbook of Quay Walls provides the reader with essential knowledge for the planning design execution and maintenance of quay walls as well as general information about historical developments and lessons learned from the observation of ports in various countries Technical chapters are followed by a detailed calculation of a quay wall based on a semi probabilistic design procedure which applies the theory presented earlier Since the publication of the Dutch edition in 2003 and the English version in 2005 considerable new experience has been obtained by the many practitioners using the book prompting the update of this handbook Moreover the introduction of the Eurocodes in 2012 has prompted a complete revision of the Design chapter which is now compliant with the Eurocodes Furthermore additional recommendations for using FEM analysis in quay wall design have been included In response to ongoing discussions within the industry about buckling criteria for steel pipe piles a thorough research project was carried out on steel pipe piles filled with sand and on piles without sand The results of this research programme have also been incorporated in this new version Finally the section on corrosion has been updated to reflect the latest knowledge and attention has been given to the latest global developments in quay wall engineering The new edition was made possible thanks to the contributions of numerous experts from the Netherlands and Belgium
