

Color Test

Certain compounds of transition metals have specific colors. For example:

- Copper compounds are blue
- Iron (II) compounds are light green
- Iron (III) compounds are orange/brown

You should do some research to find out what the typical colors of these compounds are. That will help you in quickly determining what your compound may be.

Example: You have to decide between Na_2SO_4 versus CuSO_4 . Since Na_2SO_4 is just a white solid and CuSO_4 is blue, looking at the color of the solid will immediately tell you which solid you have.

Halogen/Halide Test

If your compound contains a halide anion, Cl^- , Br^- , or I^- , you can test for their presence using the halogen/halide test. This reaction oxidizes the halide to a halogen: Cl_2 , Br_2 , or I_2 which has distinct colors. The procedure is based on an experiment you did in Chem 11 called Periodic Properties of Group 2A and 7A Elements.
