Practical Guide to Handling Laser Diode Beams Haiyin Sun, 2015-02-20 This book offers the reader a practical guide to the control and characterization of laser diode beams. Laser diodes are the most widely used lasers accounting for 50% of the global laser market. Correct handling of laser diode beams is the key to the successful use of laser diodes and this requires an in depth understanding of their unique properties. Following a short introduction to the working principles of laser diodes the book describes the basics of laser diode beams and beam propagation including Zemax modeling of a Gaussian beam propagating through a lens. The core of the book is concerned with laser diode beam manipulations: collimating and focusing, circularization and astigmatism correction, coupling into a single mode optical fiber, diffractive optics and beam shaping and manipulation of multi transverse mode beams. The final chapter of the book covers beam characterization methods describing the measurement of spatial and spectral properties including wavelength and linewidth measurement techniques. The book is a significantly revised and expanded version of the title *Laser Diode Beam Basics: Manipulations and Characterizations* by the same author. New topics introduced in this volume include laser diode types and working principles, non paraxial Gaussian beam, Zemax modeling, numerical analysis of a laser diode beam, spectral property, characterization methods and power and energy characterization techniques. The book approaches the subject in a practical way with mathematical content kept to the minimum level required, making the book a convenient reference for laser diode users.

Optical Trapping And Manipulation Of Neutral Particles Using Lasers: A Reprint Volume With Commentaries Arthur Ashkin, 2006-12-29 This important volume contains selected papers and extensive commentaries on laser trapping and manipulation of neutral particles using radiation pressure forces. Such techniques apply to a variety of small particles such as atoms, molecules, macroscopic dielectric particles, living cells and organelles within cells. These optical methods have had a revolutionary impact on the fields of atomic and molecular physics, biophysics and many aspects of nanotechnology. In atomic physics the trapping and cooling of atoms down to nanokelvins and even picokelvin temperatures are possible. These are the lowest temperatures in the universe. This made possible the first demonstration of Bose-Einstein condensation of atomic and molecular vapors. Some of the applications are high precision atomic clocks, gyroscopes, the measurement of gravity, cryptography, atomic computers, cavity quantum electrodynamics and coherent atom lasers. A major application in biophysics is the study of the mechanical properties of the many types of motor molecules, mechanoenzymes and other macromolecules responsible for the motion of organelles within cells and the locomotion of entire cells. Unique in vitro and in vivo assays study the driving forces, stepping motion, kinetics and efficiency of these motors as they move along the cell's cytoskeleton. Positional and temporal resolutions have been achieved, making possible the study of RNA and DNA polymerases as they undergo their various copying, backtracking and error correcting functions on a single base pair basis. Many applications in nanotechnology involve particle and cell sorting, particle rotation, microfabrication of simple machines, microfluidics and other micrometer devices. The number of applications continues to grow at a rapid rate. The author is the discoverer of optical

trapping and optical tweezers With his colleagues he first demonstrated optical levitation the trapping of atoms and tweezer trapping and manipulation of living cells and biological particles This is the only review volume covering the many fields of optical trapping and manipulation The intention is to provide a selective guide to the literature and to teach how optical traps really work
