Linda Dalrymple Henderson,2018-05-18 The long awaited new edition of a groundbreaking work on the impact of alternative concepts of space on modern art In this groundbreaking study first published in 1983 and unavailable for over a decade Linda Dalrymple Henderson demonstrates that two concepts of space beyond immediate perception the curved spaces of non Euclidean geometry and most important a higher fourth dimension of space were central to the development of modern art The possibility of a spatial fourth dimension suggested that our world might be merely a shadow or section of a higher dimensional existence That iconoclastic idea encouraged radical innovation by a variety of early twentieth century artists ranging from French Cubists Italian Futurists and Marcel Duchamp to Max Weber Kazimir Malevich and the artists of De Stijl and Surrealism In an extensive new Reintroduction Henderson surveys the impact of interest in higher dimensions of space in art and culture from the 1950s to 2000 Although largely eclipsed by relativity theory beginning in the 1920s the spatial fourth dimension experienced a resurgence during the later 1950s and 1960s In a remarkable turn of events it has returned as an important theme in contemporary culture in the wake of the emergence in the 1980s of both string theory in physics with its ten or eleven dimensional universes and computer graphics Henderson demonstrates the importance of this new conception of space for figures ranging from Buckminster Fuller Robert Smithson and the Park Place Gallery group in the 1960s to Tony Robbin and digital architect Marcos Novak *Gaither's Dictionary of Scientific Quotations* Carl C.

The (Pre-)dawning Of Functional Specialization In Physics Terrance J Quinn, 2017-03-14 In modern physics various fundamental problems have become topics of ongoing debate There was the 20th century climb to a Standard Model still accurate at the highest energy levels obtainable so far But since the 1970 s a different approach to physics advocates for theories such as string theory known for their mathematical elegance even though they either cannot be verified in data or contradict presently known experimental results In philosophy of physics there is a gradually emerging consensus that philosophy of physics and physics somehow contribute to a common enterprise But there is little sign of progress toward consensus about the nature of that unity All the while it is generally recognized that physics is interdisciplinary There are of course differences in focus But implicitly at least there are no sharp dividing lines between physics and philosophy of physics pure and applied physics physical chemistry biophysics medical physics history and philosophy of physics physics and society physics education and so on What then is progress in physics The question here is not about ideal structures but asks about what is going on in physics Beginnings in discerning the presence of eight main tasks help reveal the pre emergence of a normative omni disciplinary basis for collaboration that once adverted to promises to be constitutive of a new and increasingly effective control of meaning Originally discovered by Bernard Lonergan in 1965 progress in the new collaboration will not seek to eliminate specialized expertise It will though divide tasks within an eightfold functional division of labor This book invites attention to data for each of the eight main tasks evident and self evident in existing scholarship in the community The book also makes preliminary efforts toward envisioning something of what functional collaboration will look like in physics the Academy and Society
