

SELECTIVE MUTISM: KEY THINGS TO KNOW

INTRODUCTION

Selective mutism is a persistent failure to speak in specific social situations (e.g. at school), despite speaking fluently in familiar situations.

Children with selective mutism can appear socially withdrawn, oppositional, perfectionistic, or have an increased degree of emotional or sensory sensitivity.

Early intervention leads to better outcomes and reduces negative effects on social development, educational progress, and emotional health.

TREATMENTS

Psychologists and speech pathologists both play important roles in treating children with selective mutism.

Treatment usually involves a combination of behavioural, speech, and family therapies, teaching the child that they can have more control over their environment by using their words.

Community desensitisation is a program that exposes a child to communication situations with controlled, gradual increases in verbal expectations.

The goal of therapy is to reduce anxiety and increase confidence in speaking.

Therapy involves creative and fun activities (e.g. drawing, colouring, turn-based games), with natural consequences.

The desensitisation hierarchy involves four stages: nonverbal, ghost/whisper, motor/voice, and generalisation.

It's important there is a carryover in expectations at each stage in therapy to other contexts, such as at school and at home. Parents and teachers should be actively involved at all stages.

Speech pathologists often include oral language, speech or social goals into their activities to address secondary language or speech issues contributing to selective mutism.
