European Symposium on Computer Aided Process Engineering João A. Fabro, Sérgio L. Stebel, L.V.R. Arruda, Flávio Neves, Ana Paula F.D. Barbosa-Póvoa, Susana Relvas, 2013-06-10 This paper presents a novel approach to aid the operational decision making of scheduling activities in a real world pipeline used to transport heavy oil derivatives Heavy oil derivatives are products of less aggregate value such as fuel oils e.g. Marine Fuel These products present some special characteristics for their transport Indeed due to their viscosity at the room temperature it is impossible to transport them without heating Thus when transporting such products through pipelines the entire pipeline network and the storage tanks must be maintained

heated during the entire pumping process. Such characteristics imply that a specific model oriented to this type of problem must be developed. Some papers have already addressed scheduling decisions within pipeline networks but the considered scenario is particularly complex. In a heavy oil derivatives pipeline system it is common to use the same tank for different products during the scheduling horizon thus changing the aggregate capacity of storage for some products. This procedure is known as the exchange of service of the tank. In order to perform the programmed movements it is frequent the relocation of a tank from one product to another decreasing the storage capacity of the former while increasing the later. In addition a lot of constraints are modelled as instance product blending in line tankage constraints volume of pipes production consumption constraints and a series of operational requirements. The approach proposed in this work is formed by a decomposition procedure that uses a sequence of mathematic models and heuristicsto solve the problem. The proposed approach is tested using a real world scenario composed of a pipeline tree system. The model has been extensively tested in typical operational scenarios. Such models have been solved to optimality in few CPU seconds using a commercial package

Ying Cheng, Hua-Hua Chang, 2014-03-01 Over the past thirty years, student assessment has become an increasingly important component of public education. A variety of methodologies in testing have been developed to obtain and interpret the wealth of assessment outcomes. As assessment goals are getting increasingly multifaceted, new testing methodologies are called for to provide more accessible and reliable information on more complex constructs or processes such as students' critical thinking and problem-solving skills. Testing methodologies are needed to extract information from assessments on such complicated skills in order to advise teachers about certain areas of students that need intervention. It is even a bigger challenge and a vital mission of today's large-scale assessments to gain such information from testing data in an efficient manner. For example, PARCC and Smarter Balanced Assessments consortia are both striving to offer formative assessments through individualized, tailored testing. The book provides state-of-the-art coverage on new methodologies to support traditional summative assessment and more importantly for emerging formative assessments. **IBM Technical Disclosure Bulletin** International Business Machines Corporation, 1980 **AI*IA 2018 -**
