**XIII Mediterranean Conference on Medical and Biological Engineering and Computing 2013** Laura M. Roa Romero,2013-10-01 The general theme of MEDICON 2013 is Research and Development of Technology for Sustainable Healthcare This decade is being characterized by the appearance and use of emergent technologies under development This situation has produced a tremendous impact on Medicine and Biology from which it is expected an unparalleled evolution in these disciplines towards novel concept and practices The consequence will be a significant improvement in health care and well fare i e the shift from a reactive medicine to a preventive medicine This shift implies that the citizen will play an important role in the healthcare delivery process what requires a comprehensive and personalized assistance In this context society will meet emerging media incorporated to all objects capable of providing a seamless adaptive anticipatory unobtrusive and pervasive assistance The challenge will be to remove current barriers related to the lack of knowledge required to produce new opportunities for all the society while new paradigms are created for this inclusive society to be socially and economically sustainable and respectful with the environment In this way these proceedings focus on the convergence of biomedical engineering topics ranging from formalized theory through experimental science and technological development to practical clinical applications

Payan,2012-04-27 This volume focuses on the biomechanical modeling of biological tissues in the context of Computer Assisted Surgery CAS More specifically deformable soft tissues are addressed since they are the subject of the most recent developments in this field The pioneering works on this CAS topic date from the 1980 s with applications in orthopaedics and biomechanical models of bones More recently however biomechanical models of soft tissues have been proposed since most of the human body is made of soft organs that can be deformed by the surgical gesture Such models are much more complicated to handle since the tissues can be subject to large deformations non linear geometrical framework as well as complex stress strain relationships non linear mechanical framework Part 1 of the volume presents biomechanical models that have been developed in a CAS context and used during surgery This is particularly new since most of the soft tissues models already proposed concern Computer Assisted Planning with a pre operative use of the models Then the volume addresses the two key issues raised for an intra operative use of soft tissues models namely Part 2 how to estimate the in vivo mechanical behavior of the tissues i e what are the values of the mechanical parameters that can deliver realistic patient specific behavior and Part 3 how to build a modeling platform that provides generic real time or at least interactive time numerical simulations      **Image Analysis** Puneet Sharma,Filippo Maria Bianchi,2017-05-22 The two volume set LNCS

**Cloud-Based Benchmarking of Medical Image Analysis** Allan Hanbury,Henning Müller,Georg Langs,2017-05-16 This book is open access under a CC BY NC 2 5 license This book presents the VISCERAL project benchmarks for analysis and retrieval of 3D medical images CT and MRI on a large scale which used an innovative cloud based evaluation approach where the image data were stored centrally on a cloud infrastructure and participants placed their programs in virtual machines on the cloud The book presents the points of view of both the organizers of the VISCERAL benchmarks and the participants The book is divided into five parts Part I presents the cloud based benchmarking and Evaluation as a Service paradigm that the VISCERAL benchmarks used Part II focuses on the datasets of medical images annotated with ground truth created in VISCERAL that continue to be available for research It also covers the practical aspects of obtaining permission to use medical data and manually annotating 3D medical images efficiently and effectively The VISCERAL benchmarks are described in Part III including a presentation and analysis of metrics used in evaluation of medical image analysis and search Lastly Parts IV and V present reports by some of the participants in the VISCERAL benchmarks with Part IV devoted to the anatomy benchmarks and Part V to the retrieval benchmark This book has two main audiences the datasets

as well as the segmentation and retrieval results are of most interest to medical imaging researchers while eScience and computational science experts benefit from the insights into using the Evaluation as a Service paradigm for evaluation and benchmarking on huge amounts of data      Pattern Recognition and Image Analysis Hélder J. artery disease interventional C arm based fluoroscopy is an imaging method of choice While these C arm systems are also capable of rotating around the patient and thus allow a CT like 3 D image reconstruction their long rotation time of about five seconds leads to strong motion artefacts in 3 D coronary artery imaging In this work a novel method is introduced that is based on a 2 D 2 D image registration algorithm It is embedded in an iterative algorithm for motion estimation and compensation and does not require any complex segmentation or user interaction It is thus fully automatic which is a very desirable feature for interventional applications The method is evaluated on simulated and human clinical data Overall it could be shown that the method can be successfully applied to a large set of clinical data without user interaction or parameter changes and with a high robustness against initial 3 D image quality while delivering results that are at least up to the current state of the art and better in many cases
