

Chapter 3

Mathematical Modeling of Dynamic System

3.1 Introduction

- ❖ A mathematical model of a dynamic system is defined as a set of equations that represents the dynamics of the system accurately, or at least fairly well.
- ❖ Note that a mathematical model is not unique to a given system. A system may be represented in many different ways and, therefore, may have many mathematical models, depending on one's perspective.
- ❖ The dynamics of many systems, whether they are mechanical, electrical, thermal, economic, biological, and so on, may be described in terms of differential equations.
- ❖ Such differential equations may be obtained by using physical laws governing a particular system—for example,
 - ❖ Newton's laws for mechanical systems and
 - ❖ Kirchhoff's laws for electrical systems.

Modeling and Analysis of Dynamic Systems - Solutions Manual Taylor & Francis Group, 2010-03-02 The principal goal of this volume is to provide thorough knowledge of mathematical modeling and analysis of dynamic systems The author introduces MATLAB and Simulink at the outset and uses them throughout to perform symbolic graphical numerical and simulation tasks The text is accompanied by a CD that contains user defined functions M files that are executable in MATLAB as well as additional exercises on MATLAB and Simulink applications The author meticulously covers techniques for modeling dynamic systems methods of response analysis and the fundamentals of vibration and control systems Each chapter features examples exercises and a summary *Solutions Manual, Modeling and Analysis of Dynamic Systems, Second Edition* Charles M. Close, 1994-12-09 *Modeling and Analysis of Dynamic Systems* Charles M. Close, Dean K.

Frederick, Jonathan C. Newell, 2001-08-20 The third edition of Modeling and Analysis of Dynamic Systems continues to present students with the methodology applicable to the modeling and analysis of a variety of dynamic systems regardless of their physical origin It includes detailed modeling of mechanical electrical electro mechanical thermal and fluid systems Models are developed in the form of state variable equations input output differential equations transfer functions and block diagrams The Laplace transform is used for analytical solutions Computer solutions are based on MATLAB and Simulink Examples include both linear and nonlinear systems An introduction is given to the modeling and design tools for feedback control systems The text offers considerable flexibility in the selection of material for a specific course Students majoring in many different engineering disciplines have used the text Such courses are frequently followed by control system design courses in the various disciplines **Solutions Manual for Simulation of Dynamic Systems with MATLAB and Simulink** Klee/Harold, 2007-02-01

Nonlinear Dynamics and Chaos with Student Solutions Manual Steven H. Strogatz, 2018-09-21 This textbook is aimed at newcomers to nonlinear dynamics and chaos especially students taking a first course in the subject The presentation stresses analytical methods concrete examples and geometric intuition The theory is developed systematically starting with first order differential equations and their bifurcations followed by phase plane analysis limit cycles and their bifurcations and culminating with the Lorenz equations chaos iterated maps period doubling renormalization fractals and strange attractors *Mathematical Modelling of Aerospace Dynamic Systems with Practical Applications* Jitendra R. Raol, V.P.S. Symposium on Emerging Trends in Rotor Dynamics K. Gupta, 2011-01-06 Rotor dynamics is an important branch of dynamics that deals with behavior of rotating machines ranging from very large systems like power plant rotors for example a turbogenerator to very small systems like a tiny dentist's drill with a variety of rotors such as pumps compressors steam gas turbines motors turbopumps etc as used for example in process industry falling in between The speeds of these rotors vary in a large range from a few hundred RPM to more than a hundred thousand RPM Complex systems of rotating shafts depending upon their specific requirements are supported on different types of bearings There are rolling element bearings various kinds of fluid film bearings foil and gas bearings magnetic bearings to name but a few The present day rotors are much lighter handle a large amount of energy and fluid mass operate at much higher speeds and therefore are most susceptible to vibration and instability problems This has given rise to several interesting physical phenomena some of which are fairly well understood today while some are still the subject of continued investigation Research in rotor dynamics started more than one hundred years ago The progress of the research in the early years was slow However with the availability of larger computing power and versatile measurement technologies research in all aspects of rotor dynamics has accelerated over the past decades The demand from industry for light weight high performance and reliable rotor bearing systems is the driving force for research and new developments in the field of rotor dynamics The symposium proceedings contain papers on various important aspects of rotor dynamics such as modeling analytical computational and experimental methods developments in bearings dampers seals including magnetic bearings rub impact and foundation effects turbomachine blades active and passive vibration control strategies including control of instabilities nonlinear and parametric effects fault diagnostics and condition monitoring and cracked rotors This volume is of immense value to teachers researchers in educational institutes scientists researchers in R D laboratories and practising engineers in industry
