Abstract *Background:* The purpose of this study was to determine the prevalence of self-reported mental health problems in a community sample of young adults. *Methods:* A cross-sectional survey of 1,000 young adults (18–24 years) was conducted. The survey included a validated self-report measure of mental health problems. *Results:* The prevalence of self-reported mental health problems was 12.5%. The most common self-reported mental health problems were anxiety disorders (5.5%), depression (4.5%), and substance use disorders (2.5%). *Conclusions:* The prevalence of self-reported mental health problems in this community sample of young adults is higher than the prevalence of self-reported mental health problems in the general population. This finding suggests that young adults may be at a higher risk for mental health problems than the general population.
