**Citation Analysis in Research Evaluation** Henk F. Moed, 2006-03-30 This book is written for members of the scholarly research community and for persons involved in research evaluation and research policy More specifically it is directed towards the following four main groups of readers All scientists and scholars who have been or will be subjected to a quantitative assessment of research performance using citation analysis Research policy makers and managers who wish to become conversant with the basic features of citation analysis and about its potentialities and limitations Members of peer review committees and other evaluators who consider the use of citation analysis as a tool in their assessments Practitioners and students in the field of quantitative science and technology studies informetrics and library and information science Citation analysis involves the construction and application of a series of indicators of the

impact influence or quality of scholarly work derived from citation data i.e. data on references cited in footnotes or bibliographies of scholarly research publications. Such indicators are applied both in the study of scholarly communication and in the assessment of research performance. The term scholarly comprises all domains of science and scholarship including not only those fields that are normally denoted as science: the natural and life sciences, mathematical and technical sciences but also social sciences and humanities.

How to Write and Publish a Scientific Paper Robert A. Day, Barbara Gastel, 2012-06-07. An essential guide providing beginning scientists and experienced researchers with practical advice on writing about their work and getting published.

**Beyond open access: visions for open evaluation of scientific papers by post-publication peer review** Nikolaus Kriegeskorte, Diana Deca. A scientific publication system needs to provide two basic services: access and evaluation. The traditional publication system restricts the access to papers by requiring payment and it restricts the evaluation of papers by relying on just 2-4 pre-publication peer reviews and by keeping the reviews secret. As a result, the current system suffers from a lack of quality and transparency of the peer review evaluation process and the only immediately available indication of a new paper's quality is the prestige of the journal it appeared in. Open access is now widely accepted as desirable and is slowly beginning to become a reality. However, the second essential element, evaluation, has received less attention. Open evaluation, an ongoing post-publication process of transparent peer review and rating of papers, promises to address the problems of the current system. However, it is unclear how exactly such a system should be designed. The evaluation system steers the attention of the scientific community and thus the very course of science. For better or worse, the most visible papers determine the direction of each field and guide funding and public policy decisions. Evaluation therefore is at the heart of the entire endeavor of science. As the number of scientific publications explodes, evaluation and selection will only gain importance. A grand challenge of our time therefore is to design the future system by which we evaluate papers and decide which ones deserve broad attention. So far, scientists have left the design of the evaluation process to journals and publishing companies. However, the steering mechanism of science should be designed by scientists. The cognitive, computational, and brain sciences are best prepared to take on this task, which will involve social and psychological considerations, software design, and modeling of the network of scientific papers and their interrelationships. This Research Topic in *Frontiers in Computational Neuroscience* collects visions for a future system of open evaluation. Because critical arguments about the current system abound, these papers will focus on constructive ideas and comprehensive designs for open evaluation systems. Design decisions include: Should the reviews and ratings be entirely transparent or should some aspects be kept secret? Should other information such as paper downloads be included in the evaluation? How can scientific objectivity be strengthened and political motivations weakened in the future system? Should the system include signed and authenticated reviews and ratings? Should the evaluation be an ongoing process such that promising papers are more deeply evaluated? How can we bring science and statistics to the evaluation process, e.g.

should rating averages come with error bars How should the evaluative information about each paper e g peer ratings be combined to prioritize the literature Should different individuals and organizations be able to define their own evaluation formulae e g weighting ratings according to different criteria How can we efficiently transition toward the future system Ideally the future system will derive its authority from a scientific literature on community based open evaluation We hope that these papers will provide a starting point
