IUTAM Symposium on Emerging Trends in Rotor Dynamics K. Gupta,2011-01-06 Rotor dynamics is an important branch of dynamics that deals with behavior of rotating machines ranging from very large systems like power plant rotors for example a turbogenerator to very small systems like a tiny dentist s drill with a variety of rotors such as pumps compressors steam gas turbines motors turbopumps etc as used for example in process industry falling in between The speeds of these rotors vary in a large range from a few hundred RPM to more than a hundred thousand RPM Complex systems of rotating shafts depending upon their specific requirements are supported on different types of bearings There are rolling element bearings various kinds of fluid film bearings foil and gas bearings magnetic bearings to name but a few The present day rotors are much lighter handle a large amount of energy and fluid mass operate at much higher speeds and therefore are most susceptible to vibration and instability problems This have given rise to several interesting physical phenomena some of which are fairly well understood today while some are still the subject of continued investigation Research in rotor dynamics started more than one hundred years ago The progress of the research in the early years was slow However with the availability of larger computing power and versatile measurement technologies research in all aspects of rotor dynamics has accelerated over the past decades The demand from industry for light weight high performance and reliable rotor bearing

systems is the driving force for research and new developments in the field of rotor dynamics The symposium proceedings contain papers on various important aspects of rotor dynamics such as modeling analytical computational and experimental methods developments in bearings dampers seals including magnetic bearings rub impact and foundation effects turbomachine blades active and passive vibration control strategies including control of instabilities nonlinear and parametric effects fault diagnostics and condition monitoring and cracked rotors This volume is of immense value to teachers researchers in educational institutes scientists researchers in R D laboratories and practising engineers in industry

Medicine Meets Engineering Joachim Hammer, Michael Nerlich, Sebastian Dendorfer, 2008 Biomedical Engineering is defined as the science that integrates medical and engineering sciences to improve diagnosis and treatment of patients Only by this integration progress can be achieved Both medical and engineering sciences comprise a huge diversity in topics so it is imaginable that Biomedical Engineering combining these two science areas is even more huge Thanks to this megadisciplinary approach many breakthroughs can be achieved More and more research groups realize this and start new research projects which results in a rapid increase in knowledge in Biomedical Engineering This will only benefit the main goal of Biomedical Engineering improving diagnosis and treatment of patients when it is spread and applied The 2nd Regensburg Applied Biomechanics conference is special in that it realized both the distribution of new knowledge and the essential integration of medical and engineering specialists The conference dealt with the latest results in applied biomechanics ranging from fundamental bone strength properties via bone remodeling phenomena to new implants that replace lost human functions Also new research areas like robot surgery and tissue engineering were discussed
