Computational Optimization of Internal Combustion Engines Yu Shi, Hai-Wen Ge, Rolf D. Reitz, 2011-06-22

Computational Optimization of Internal Combustion Engines presents the state of the art of computational models and optimization methods for internal combustion engine development using multi dimensional computational fluid dynamics CFD tools and genetic algorithms Strategies to reduce computational cost and mesh dependency are discussed as well as regression analysis methods Several case studies are presented in a section devoted to applications including assessments of spark ignition engines dual fuel engines heavy duty and light duty diesel engines Through regression analysis optimization results are used to explain complex interactions between engine design parameters such as nozzle design injection timing swirl exhaust gas recirculation bore size and piston bowl shape Computational Optimization of Internal Combustion Engines demonstrates that the current multi dimensional CFD tools are mature enough for practical development of internal combustion engines It is written for researchers and designers in mechanical engineering and the automotive industry

Simulation and Optimization of Internal Combustion Engines Zhiyu Han, 2021-12-28 Simulation and Optimization of Internal Combustion Engines provides the fundamentals and up to date progress in multidimensional simulation and optimization of internal combustion engines While it is impossible to include all the models in a single book this book intends to introduce the pioneer and or the often used models and the physics behind them providing readers with ready to use knowledge Key issues useful modeling methodology and techniques as well as instructive results are discussed through examples Readers will understand the fundamentals of these examples and be inspired to explore new ideas and means for better solutions in their studies and work Topics include combustion basis of IC engines mathematical descriptions of reactive flow with sprays engine in cylinder turbulence fuel sprays combustions and pollutant emissions optimization of direct injection gasoline engines and optimization of diesel and alternative fuel engines *1D and Multi-D Modeling*

Techniques for IC Engine Simulation Angelo Onorati, Gianluca Montenegro, 2020-04-06 1D and Multi D Modeling Techniques for IC Engine Simulation provides a description of the most significant and recent achievements in the field of 1D engine simulation models and coupled 1D 3D modeling techniques including 0D combustion models quasi 3D methods and some 3D model applications

An Innovative 3D-CFD-Approach towards Virtual Development of Internal Combustion Engines Marco Chiodi, 2011-03-07 In the engine development process simulation and predictive programs have continuously gained in reliance Due to the complexity of future internal combustion engines the application of simulation programs towards a reliable virtual engine development is a need that represents one of the greatest challenges Marco Chiodi presents an innovative 3D CFD tool exclusively dedicated and optimized for the simulation of internal combustion engines Thanks to improved or newly developed 3D CFD models for the description of engine processes this tool ensures an efficient and reliable calculation also by using coarse 3D CFD meshes Based on this approach the CPU time can be reduced up to a factor

100 in comparison to traditional 3D CFD simulations In addition an integrated and automatic evaluation tool establishes a comprehensive analysis of the relevant engine parameters Due to the capability of a reliable virtual development of full engines this fast response 3D CFD tool makes a major contribution to the engine development process S dwestmetall F rderpreis 2010

Combustion Engines Development Günter P. Merker, Christian Schwarz, Rüdiger Teichmann, 2011-09-24 Combustion Engines Development nowadays is based on simulation not only of the transient reaction of vehicles or of the complete driveshaft but also of the highly unsteady processes in the carburation process and the combustion chamber of an engine Different physical and chemical approaches are described to show the potentials and limits of the models used for simulation

La Modélisation multidimensionnelle des écoulements dans les moteurs Thierry Baritaud, 1999 With an increasingly challenging commercial environment and the need imposed by safety principles to reduce both fuel consumption and pollutant emissions the development of new engines can now benefit from the advances of computational fluid dynamics Engine CFD is a most challenging simulation problem This is caused by the spread of time and space scales the excursion amplitude of most parameters the high quasi cyclic unstationarity of engine flows the importance of minor geometry details the number of physical and chemical processes including turbulent combustion and multi phase flows to model However engine CFD has now reached a state where it has become a widely used tool not only for engine understanding but also increasingly for engine design Undoubtedly laser diagnostics in optical access engines have also brought significant help

Modeling of End-Gas Autoignition for Knock Prediction in Gasoline Engines

Andreas Manz, 2016-08-18 Downsizing of modern gasoline engines with direct injection is a key concept for achieving future CO₂ emission targets However high power densities and optimum efficiency are limited by an uncontrolled autoignition of the unburned air fuel mixture the so called spark knock phenomena By a combination of three dimensional Computational Fluid Dynamics 3D CFD and experiments incorporating optical diagnostics this work presents an integral approach for predicting combustion and autoignition in Spark Ignition SI engines The turbulent premixed combustion and flame front propagation in 3D CFD is modeled with the G equation combustion model i.e. a laminar flamelet approach in combination with the level set method Autoignition in the unburned gas zone is modeled with the Shell model based on reduced chemical reactions using optimized reaction rate coefficients for different octane numbers ON as well as engine relevant pressures temperatures and EGR rates The basic functionality and sensitivities of improved sub models e.g. laminar flame speed are proven in simplified test cases followed by adequate engine test cases It is shown that the G equation combustion model performs well even on unstructured grids with polyhedral cells and coarse grid resolution The validation of the knock model with respect to temporal and spatial knock onset is done with fiber optical spark plug measurements and statistical

evaluation of individual knocking cycles with a frequency based pressure analysis The results show a good correlation with the Shell autoignition relevant species in the simulation The combined model approach with G equation and Shell autoignition in an active formulation enables a realistic representation of thin flame fronts and hence the thermodynamic conditions prior to knocking by taking into account the ignition chemistry in unburned gas temperature fluctuations and self acceleration effects due to pre reactions By the modeling approach and simulation methodology presented in this work the overall predictive capability for the virtual development of future knockproof SI engines is improved *Reports of Cases Adjudged in the Court of Appeals of the District of Columbia* District of Columbia.
