- a) FCFS
- b) SJF
- c) Round Robin
- d) Priority

a)FCFS (First Come First Serve)

Aim: Write a C program to implement the various process scheduling mechanisms such as FCFS scheduling.

Algorithm:

- 1: Start the process
- 2: Accept the number of processes in the ready Queue
- 3: For each process in the ready Q, assign the process id and accept the CPU burst time
- 4: Set the waiting of the first process as '0' and its burst time as its turn around time
- 5: for each process in the Ready Q calculate
 - a. Waiting time for process(n)= waiting time of process (n-1) + Burst time of process(n-1)
 - b. Turnaround time for Process(n)= waiting time of Process(n)+ Burst time for process(n)
- 6: Calculate
 - a. Average waiting time = Total waiting Time / Number of process
 - b. Average Turnaround time = Total Turnaround Time / Number of process
- 7: Stop the process

Linux for Beginners John S Code, 2020-03-17

Are you a lover of computer programming Are you eager to explore the adventures that run beneath the computer It is high time you resolved your mind to understand the tricks behind Linux Sorry Linux is not a programming language What is it then If you have spent much time in the world of computer technology you have probably come across the name Linux several times You may have heard that it is open source and available for free download but that information doesn't explain what Linux actually is You need to stick your attention to this book to be able to find out what Linux is Amid the riddle to be unraveled you should be eager to become a master of Linux You are confused on where you ought to start right Do you have the interest to explore a platform that does not have a defined graphical user interface Linux is the way to go It is a wonderful operating system you will love The main idea and start of our modern day operating systems was the need to create ISG including them in the use of computer systems By computer cybernetic system we mean a set of hardware and software The computer cybernetic system initially developed for liability solutions and practical problems of users Because it was difficult to do this with hardware alone applications were created These programs required general operations of hardware management distribution of hardware from resources and the like These operations are grouped under a separate layer of software which is known as the operating system Further the capabilities of operating systems went far beyond the basic set of operations required by applications but the intermediate position of such systems between applications and hardware remained unchanged First off Linux is often put alongside other operating systems such as Windows and Mac and then directly compared However this isn't exactly fair to Linux in a good way or a bad way Linux itself is only a kernel a kernel is the formal core of a given operating system on which everything else rests The kernel is the core piece of software which powers essential technologies such as file management systems basic system processes like time and date information and things of that nature The kernel often will work intimately with the motherboard the RAM and the other core parts of the computer in order to provide a firm foundation for everything else This guide has lots of information that include Understanding the dynamics of operating systems Having an overview of Linux and its distros For you to fully use it you need to set it up How Linux compares to the other operating systems Working with the great CLI The basic commands that one runs on the terminals Working with files and directories How to manage all the users Who else is dreaming of becoming that individual to penetrate other systems without permission And much more Most of the books on Linux system administration as great as they are are simply outdated They all seem to come from a time when Linux more closely resembled Unix Even recently released books didn't cover the fundamental shift in how system services are started and managed on modern Linux systems With every year that passes every new version of the Linux kernel that is released and every new Linux distribution
