Building Construction Illustrated Francis D. K. Ching, 2014-04-16 The classic visual guide to the basics of building construction now with a 3D digital building model for interactive learning For over three decades Building Construction Illustrated has offered an outstanding introduction to the principles of building construction This new edition of the revered classic remains as relevant as ever providing the latest information in Francis D K Ching's signature style Its rich and comprehensive approach clearly presents all of the basic concepts underlying building construction New to this edition are digital enhancements delivered as an online companion to the print edition and also embedded in e book editions

Features include a 3D model showing how building components come together in a final project illustrated throughout with clear and accurate drawings that present the state of the art in construction processes and materials Updated and revised to include the latest knowledge on sustainability incorporation of building systems and use of new materials Contains archetypal drawings that offer clear inspiration for designers and drafters Reflects the 2012 International Building Codes and 2012 LEED system This new edition of Building Construction Illustrated remains as relevant as ever with the most current knowledge presented in a rich and comprehensive manner that does not disappoint **Manual of Recommended Practice** Association of American Railroads. Signal Section, 1925 Towards a rational understanding of shear in beams and slabs fib Fédération internationale du béton, 2018-05-01 Reliable performance of beams and slabs in shear is essential for the safety and also for the serviceability of reinforced concrete structures A possible failure in shear is usually a brittle failure which underlines the importance of the correct specification of the load carrying capacity in shear The knowledge of performance in shear is steadily developing and it is now obvious that older structures were not always designed in accordance with contemporary requirements The increasing load mainly on bridges requires the assessment of existing structures often followed by their strengthening An appropriate understanding of actual performance of concrete structures in shear is therefore of primary interest The workshop which was held in Zurich in 2016 brought together a significant number of outstanding specialists working in the field of shear design who had a chance to exchange their opinions and proposals for improving the current knowledge of shear behaviour in beams and slabs The specialists came from different parts of the world which made the workshop general and representative The workshop was organised by fib Working Party 2.2.1 Shear in Beams convened by O Bayrak which is a part of fib Commission 2 Analysis and Design Individual contributions mainly address shear in beams with low transversal reinforcement It is crucial because many existing structures lack such reinforcement Different theories e.g. Critical Shear Crack Theory CSCT Modified Compression Field Theory MCFT Multi Action Shear Model MASM etc were presented and compared with procedures used in selected national codes or in the fib Model Code 2010 The models for shear design were often based to a great extent on empirical experience The refined presented models tend to take into account the physical mechanisms in structures more effectively A brittle behaviour in shear requires not only to check the equilibrium and failure load but also to follow the progress of failure including the crack development and propagation stress redistribution etc The significance of the size effect which causes the nominal strength of a large structure to be smaller than that of a small structure was pointed out Nowadays the fibre reinforcement is used more than before since it allows significant labour costs savings in the construction industry The contribution of fibres is suitable for shear transfer It is very convenient that not only ordinary fibre reinforced elements were addressed but also the UHPFRC beams The production of this new material is indeed growing while the development of design recommendations has not been sufficiently fast Fatigue resistance of structures with low shear reinforcement is also an important issue which

was also addressed in this bulletin It cannot be neglected in prestressed bridges which are exposed to dynamic loads A comprehensive understanding of the shear behaviour is necessary Although many laboratory experiments are carried out they are suitable only to a limited extent New testing methods are being developed and show promising results e g digital image correlation An actual structure performance should rather be tested on a large scale ideally on real structures under realistic loading conditions ii The papers presented in the bulletin are a basis for the discussion in view of the development of updated design rules for the new fib Model Code MC2020 which is currently under preparation fib Bulletins like this one dealing with shear help to transfer knowledge from research to design practice The authors are convinced that it will lead to better new structures design of as well as to savings and to a safety increase in older existing structures whose future is often decided now

Race,Danilo Spasiano,2020-11-20 The recovery of solid wastes for the preparation of innovative composite materials not only represents an economic advantage but also offers an ecological opportunity for the utilization of by products which would otherwise be landfilled Specifically the reuse and recycling of waste lead to important savings of raw materials and energy since these by products generally deriv from agricultural or industrial activities are abundant in nature Moreover a reduction of the environmental and related sanitary impacts can be also achieved For this reason a recycling operation is fundamental for the improvement of the environmental sustainability because these secondary raw materials become a resource that can be easily reused without the modification of the peculiar characteristics in order to obtain new and performing composites with a low specific weight high durability and long life cycle      **Improving Concrete Quality** Karthikeyan H
