Guidelines for Manual Pure-Tone Threshold Audiometry

Working Group on Manual Pure-Tone Threshold Audiometry

These guidelines were developed by the Working Group on Manual Pure-Tone Threshold Audiometry, under the office of the Vice President for Professional Practices in Audiology of the American Speech-Language-Hearing Association (ASHA) and were approved by the ASHA Legislative Council in November 2005. Members of the Working Group were John Campbell, Jeffrey Graley, Deanna Meinke, Linda Vaughan (ex officio), Roberta Augst (monitoring vice president), and Ted Madison (chair). This set of guidelines is the fourth of a series. The first was the Guidelines for Audiometric Symbols (1990a), adopted by ASHA in December 1973. The second was the Guidelines for Identification Audiometry (1975), adopted by ASHA in November 1974. The third was the Manual Pure-Tone Threshold Audiometry Guidelines (1976), adopted by ASHA in November 1977. ASHA encourages the professional community to use these guidelines.

These guidelines present a recommended set of procedures based on existing practice and research findings. Their intention is not to mandate a single way of accomplishing a clinical process, but to suggest standard procedures that in the final analysis should benefit the persons we serve. The purpose is to improve interclinician and interclinic comparison of data, thereby allowing for a more effective transfer of information.

The American Speech-Language-Hearing Association (ASHA) *Guidelines for Manual Pure-Tone Threshold Audiometry* contain procedures for accomplishing hearing threshold measurement with pure tones that are applicable in a wide variety of settings. Diagnostic standard pure-tone threshold audiometry, used most often in clinical settings, includes manual air-conduction measurements at 250, 500, 1000, 2000, 3000, 4000, 6000, and 8000 Hz (125 Hz under some circumstances) plus bone-conduction measurements at octave intervals from 250 Hz to 4000 Hz and at 3000 Hz as needed. Also, when required, appropriate masking is used. For special purposes, extended high-frequency audiometry may be used for frequencies of 9000 to 16000 Hz. Pure-tone threshold audiometry is used for both diagnostic and monitoring purposes.

Scope

Pure-tone threshold audiometry is the measurement of an individual's hearing sensitivity for calibrated pure tones. Three general methods are used: (a) manual audiometry, also referred to as conventional audiometry; (b) automatic audiometry, also known as B&B audiometry; and (c) computerized audiometry. The guidelines presented in this document are limited to manual pure-tone audiometry. Sound field audiometry using loudspeakers is not addressed in this document. Detailed information on auditory measurements in the sound field can be found in *Sound Field Measurement Tutorial 11-371* (ASHA, 1990b).

The historical antecedents of pure-tone audiometry were the classical tuning fork tests. The development of the audiometer made it possible to control signal intensity and duration in ways that were not

Note. When guidelines and standards referred to in this document are superseded by an approved revision, the revision shall apply.
