

1. What is climate change? Support its existence with data.

Support is given by several lines of evidence:

- (a) The observed warming of several other factors by individual data, such as rising sea levels.
- (b) Systematic increases in temperature, from measurements that span all decades of climate record, and the finding of higher than physiological heat levels from the tropics to the poles.
- (c) Long-standing changes in sea level, surface air, and glaciers in response to the warming of the atmosphere.

2. Transferring some carbon that enters the system to those who understand the consequences of climate, particularly plants. Define the following:

a. Photosynthesis

They absorb light as hydrocarbon particles of biological molecules from a hydrogen, oxygen, and carbon dioxide to produce a hydrocarbon.

b. Cellular Respiration

Cellular respiration is the process of breaking down glucose and other organic molecules to produce energy. This is the main source of energy for the cell and the main source of energy for the organism.

c. Transpiration

Transpiration is the process of water moving from the roots of a plant to the leaves, where it is lost to the atmosphere. This is the main source of water for the plant and the main source of energy for the organism.

Developing Assessments for the Next Generation Science Standards National Research Council, Division of Behavioral and Social Sciences and Education, Board on Science Education, Board on Testing and Assessment, Committee on Developing Assessments of Science Proficiency in K-12, 2014-05-29 Assessments understood as tools for tracking what and how well students have learned play a critical role in the classroom Developing Assessments for the Next Generation Science Standards develops an approach to science assessment to meet the vision of science education for the future as it has been elaborated in A Framework for K 12 Science Education Framework and Next Generation Science Standards NGSS These documents are brand new and the changes they call for are barely under way but the new assessments will be needed as soon as states and districts begin the process of

implementing the NGSS and changing their approach to science education The new Framework and the NGSS are designed to guide educators in significantly altering the way K 12 science is taught The Framework is aimed at making science education more closely resemble the way scientists actually work and think and making instruction reflect research on learning that demonstrates the importance of building coherent understandings over time It structures science education around three dimensions the practices through which scientists and engineers do their work the key crosscutting concepts that cut across disciplines and the core ideas of the disciplines and argues that they should be interwoven in every aspect of science education building in sophistication as students progress through grades K 12 Developing Assessments for the Next Generation Science Standards recommends strategies for developing assessments that yield valid measures of student proficiency in science as described in the new Framework This report reviews recent and current work in science assessment to determine which aspects of the Framework's vision can be assessed with available techniques and what additional research and development will be needed to support an assessment system that fully meets that vision The report offers a systems approach to science assessment in which a range of assessment strategies are designed to answer different kinds of questions with appropriate degrees of specificity and provide results that complement one another Developing Assessments for the Next Generation Science Standards makes the case that a science assessment system that meets the Framework's vision should consist of assessments designed to support classroom instruction assessments designed to monitor science learning on a broader scale and indicators designed to track opportunity to learn New standards for science education make clear that new modes of assessment designed to measure the integrated learning they promote are essential The recommendations of this report will be key to making sure that the dramatic changes in curriculum and instruction signaled by Framework and the NGSS reduce inequities in science education and raise the level of science education for all students

promising approach for the development of innovative technical products not only in mechanical engineering but also in areas such as material science and even computer engineering. Innovations such as humanoid robots or multifunctional materials have shown the potential of bio inspired design. However in industrial companies bio inspired design remains an exotic approach which is rarely used in innovation practice. One reason for this is a lack of knowledge on how to implement bio inspired design in practice. Therefore this guide book was written to explain the application of bio inspired design methods and tools. The target groups are professional engineers and biologists as well as students of both disciplines. The book presents a selection of methods for specific activities in bio inspired design namely planning a bio inspired design project, abstraction, search, analysis and comparison and transfer of analogies. Factsheets give an overview of each method, its advantages and challenges and its suitability for different bio inspired design approaches and scenarios. To facilitate understanding all methods are explained with the help of the same example. In addition ten best practice examples show the practical applicability of bio inspired design.

Research in Education ,1970-05 **Robot Colonies** Ronald C. Arkin,George A. Bekey,2013-03-14 Robots in groups or colonies can exhibit an enormous variety and richness of behaviors which cannot be observed with singly autonomous systems Of course this is analogous to the amazing variety of group animal behaviors which can be observed in nature In recent years more and more investigators have started to study these behaviors The studies range from classifications and taxonomies of behaviors to development of architectures which cause such group activities as flocking or swarming and from emphasis on the role of intelligent agents in such groups to studies of learning and obstacle avoidance There used to be a time when many robotics researchers would question those who were interested in working with teams of robots Why are you worried about robotic teams when it s hard enough to just get one to work This issue responds to that question Robot Colonies provides a new approach to task problem solving that is similar in many ways to distributed computing Multiagent robotic teams offer the possibility of spatially distributed parallel and concurrent perception and action A paradigm shift results when using multiple robots providing a different perspective on how to carry out complex tasks New issues such as interagent communications spatial task distribution heterogeneous or homogeneous societies and interference management are now central to achieving coordinated and productive activity within a colony Fortunately mobile robot hardware has evolved sufficiently in terms of both cost and robustness to enable these issues to be studied on actual robots and not merely in simulation Robot Colonies presents a sampling of the research in this field While capturing a reasonable representation of the most important work within this area its objective is not to be a comprehensive survey but rather to stimulate new research by exposing readers to the principles of robot group behaviors architectures and theories Robot Colonies is an edited volume of peer reviewed original research comprising eight invited contributions by leading researchers This research work has also been published as a special issue of Autonomous Robots Volume 4 Number 1
