Radiation and the International Space Station National Research Council, Commission on Geosciences, Environment, and Resources, Commission on Physical Sciences, Mathematics, and Applications, Board on Atmospheric Sciences and Climate, Space Studies Board, Committee on Solar-Terrestrial Research, Committee on Solar and Space Physics, 2000-03-25 A major objective of the International Space Station is learning how to cope with the inherent risks of human spaceflight how to live and work in space for extended periods The construction of the station itself provides the first opportunity for doing so Prominent among the challenges associated with ISS construction is the large amount of time that astronauts will be spending doing extravehicular activity EVA or space walks EVAs from the space shuttle have been extraordinarily successful most notably the on orbit repair of the Hubble Space Telescope But the number of hours of EVA for ISS construction exceeds that of the Hubble repair mission by orders of magnitude Furthermore the ISS orbit has nearly twice the inclination to Earth's equator as Hubble's orbit so it spends part of every 90 minute circumnavigation at high latitudes where Earth's magnetic field is less effective at shielding impinging radiation This means that astronauts sweeping through these regions will be considerably more vulnerable to dangerous doses of energetic particles from a sudden solar eruption Radiation and the International Space Station estimates that the likelihood of having a potentially dangerous solar event during an EVA is indeed very high This report recommends steps that can be taken immediately and over the next several years to provide adequate warning so that the astronauts can be directed to take protective cover inside the ISS or shuttle The near term actions include programmatic and operational ways to take advantage of the multiagency assets that currently monitor and forecast space weather and ways to improve the in situ measurements and the predictive power of current models
