for modelling and predicting water demand are described Sample applications of the models are presented such as a water allocation decision support system for semi arid regions a multiple criteria control model for run of river hydropower plants and a supply network simulation for public services

Methods to investigate the hydrology of the Himalayan springs

Chinnasamy, Pennan,Prathapar, Sanmugam A.,2016-06-10 Springs are the major source of freshwater in many small mountainous watersheds within the Himalayan region In recent years their flow rates have diminished but the reasons for this are not self evident and hence this paper reviews the methods to investigate Himalayan springs The review reveals that chemical and isotope analyses mostly water dating and stable isotope e g d18O analyses could be an appropriate entry point to commence field investigations because of their potential to map complex spring pathways including linkages between aquifers This should be combined with the building of hydrogeological maps with the available data Output from desktop analyses field investigations and hydrogeological maps could then contribute to the establishment of a conceptual model which could form the basis for a numerical model

Modelling, Simulation and Control of Urban Wastewater Systems

Manfred Schütze,David Butler,Bruce M. Beck,2002-02-20 by Professor Poul Harremoes Environmental engineering has been a discipline dominated by empirical approaches to engineering Historically speaking the development of urban drainage structures was very successful on the basis of pure empiricism Just think of the impressive structures built by the Romans long before the discipline of hydraulics came into being The fact is that the Romans did not know much about the theories of hydraulics which were discovered as late as the mid 1800s However with the Renaissance came a new era Astronomy Galileos and basic physics Newton started the scientific revolution and in the mid 1800s Navier and Stokes developed the application of Newtons laws to hydrodynamics and later St Venant the first basic physics description of the motion of water in open channels The combination of basic physical understanding of the phenomena involved in the flow of water in pipes and the experience gained by trial and error the engineering approach to urban drainage improved the design and performance of the engineering drainage infrastructure However due to the mathematical complications of the basic equations solutions were available only to quite simple cases of practical significance until the introduction of new principles of calculation made possible by computers and their ability to crunch numbers Now even intricate hydraulic phenomena can be simulated with a reasonable degree of confidence that the simulations are in agreement with performance in practice if the models are adequately calibrated with sample performance data
