

# PROTEIN SYNTHESIS

## TRANSLATION

1. Translation is the process of synthesizing a protein from an mRNA template. The sequence of amino acids in the protein is determined by the sequence of nucleotides in the mRNA.

2. During translation, the ribosome moves along the mRNA, reading the code in groups of three nucleotides called codons. Each codon specifies a particular amino acid.

3. The amino acids are then joined together to form a growing polypeptide chain. The sequence of the polypeptide chain is determined by the sequence of the mRNA.

# THE GENETIC CODE

## "One codon at a time"

1. Biological systems use sequences of three nucleotides to specify the amino acids that are used to build proteins. These sequences are called codons.

2. Each codon specifies a particular amino acid. The sequence of amino acids in a protein is determined by the sequence of codons in the mRNA.

3. The genetic code is a "dictionary" of all the combinations of three nucleotides that specify the amino acids.

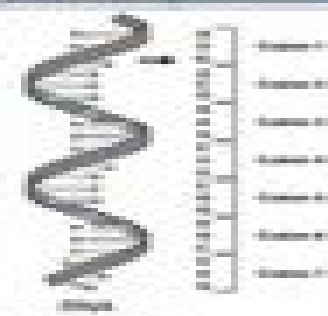

4. The genetic code is universal, meaning that it is the same in all organisms.

## "One gene - one protein"

1. Each gene contains the instructions for making a specific protein. The sequence of amino acids in the protein is determined by the sequence of nucleotides in the gene.

2. The genetic code is a "dictionary" of all the combinations of three nucleotides that specify the amino acids.

3. The genetic code is universal, meaning that it is the same in all organisms.
