Genetic Crosses With Two Traits

In his work with garden peas, Mendel also set up crosses in which he studied the inheritance of two traits at one time. For example, he crossed tall plants having green pods (TTGG) with short plants having yellow pods (ttgg). The F_1 offspring showed both traits controlled by dominant alleles, tall and green. Mendel allowed the F_1 offspring to self-pollinate. The F_2 offspring had four different phenotypes: tall plants with green pods, tall plants with yellow pods, short plants with green pods, and short plants with yellow pods. These results led Mendel to formulate the Law of Independent Assortment, which states that alleles of one gene separate or assort independently of alleles of another gene. In other words, the distribution of alleles of one gene does not affect the distribution of alleles for another gene.

Study the Punnett square of a genetic cross between two pea plants with two different traits. Then answer the questions that follow.

Answer the following questions on a separate sheet of paper.

1. What are all the possible combinations of alleles that each F_1 parent can pass on to the offspring?
2. What are the possible genotypes of the F_2 offspring? What are the possible phenotypes of the F_2 offspring?
3. What is the probability that an F_2 offspring will be tall with green pods? What is the probability that an F_2 offspring will be short with yellow pods?

Genetics Robert F. Weaver, Philip W. Hedrick, 1992 **Soviet Genetics**, 1971 *Quantitative Assessment and Validation of Network Inference Methods in Bioinformatics* Benjamin Haiibe-Kains, Frank Emmert-Streib, 2015-04-14

Scientists today have access to an unprecedented arsenal of high tech tools that can be used to thoroughly characterize biological systems of interest High throughput omics technologies enable to generate enormous quantities of data at the DNA RNA epigenetic and proteomic levels One of the major challenges of the post genomic era is to extract functional information by integrating such heterogeneous high throughput genomic data This is not a trivial task as we are increasingly coming to understand that it is not individual genes but rather biological pathways and networks that drive an organism's response to environmental factors and the development of its particular phenotype In order to fully understand the way in which these networks interact or fail to do so in specific states disease for instance we must learn both the structure of the underlying networks and the rules that govern their behavior In recent years there has been an increasing interest in methods that aim to infer biological networks These methods enable the opportunity for better understanding the interactions between genomic features and the overall structure and behavior of the underlying networks So far such network models have been mainly used to identify and validate new interactions between genes of interest But ultimately one could use these networks to predict large scale effects of perturbations such as treatment by multiple targeted drugs However currently we are still at an early stage of comprehending methods and approaches providing a robust statistical framework to quantitatively assess the quality of network inference and its predictive potential The scope of this Research Topic in Bioinformatics and Computational Biology aims at addressing these issues by investigating the various complementary approaches to quantify the quality of network models These validation techniques could focus on assessing quality of specific interactions global and local structures and predictive ability of network models These methods could rely exclusively on in silico evaluation procedures or they could be coupled with novel experimental designs to generate the biological data necessary to properly validate inferred networks

Marine Omics in a Changing Ocean: Modelling Molecular Pathways and Networks to Understand Species Acclimation and Adaptation Carolina Madeira, Piero Calosi, Diana Sofia Madeira, 2024-07-08 Global climate change is a major threat to marine biodiversity worldwide Average changes in ocean temperature pH and oxygenation are re shaping marine communities with significant impacts on the critical services that marine ecosystems provide to mankind As global climate change continues the frequency duration and intensity of extreme weather events are

also predicted to increase with fast and far reaching consequences on marine species including mass mortality and disruption of ecological processes As a result millions of ocean dependent livelihoods and jobs are also at risk with consequent economic impacts Given the current climate and biodiversity crisis the Intergovernmental Science Policy Platform on Biodiversity and Ecosystem Services has emphasized the relevance of 1 increasing knowledge and protection of biodiversity and 2 assessing species climate driven extinction risks To achieve these goals we need to understand organism environment ecology evolution interactions at various levels of the biological hierarchy from molecules to ecosystems However we are still lacking a comprehensive understanding of the molecular mechanisms shaping phenotypic landscapes in the natural environment and under different global change scenarios To address such challenges a new strategic program was also launched by the European Molecular Biology Laboratory EMBL Molecules to Ecosystems to study life in context and provide new research avenues in molecular life sciences In this context the emerging disciplines of Marine Omics and Marine Systems Biology will be key to supporting innovative solutions in marine ecosystem conservation and blue bioeconomy for example uncover molecular traits underlying sensitivity tolerance to environmental change supporting assisted evolution approaches molecular targets that can be used for diagnostics monitoring and development of biotechnological applications

The Molecular Basis of Plant Genetic Diversity Mahmut Caliskan,2012-03-30 The Molecular Basis of Plant Genetic Diversity presents chapters revealing the magnitude of genetic variations existing in plant populations Natural populations contain a considerable genetic variability which provides a genomic flexibility that can be used as a raw material for adaptation to changing environmental conditions The analysis of genetic diversity provides information about allelic variation at a given locus The increasing availability of PCR based molecular markers allows the detailed analyses and evaluation of genetic diversity in plants and also the detection of genes influencing economically important traits The purpose of the book is to provide a glimpse into the dynamic process of genetic variation by presenting the thoughts of scientists who are engaged in the generation of new ideas and techniques employed for the assessment of genetic diversity often from very different perspectives The book should prove useful to students researchers and experts in the area of conservation biology genetic diversity and molecular biology Subtelomeres

Edward J Louis,Marion M Becker,2013-12-18 New genes and diversity leading to adaptation and evolution are generated in special areas of genomes One such area in all eukaryotic genomes and in those prokaryotes with linear chromosomes is the region near the ends of the chromosomes These telomere associated sequences or subtelomeres have different properties than the rest of the genome and are one of the most exciting frontiers left in genomics This book provides a broad introduction to the field of subtelomeres with detailed information from various fields and systems covering yeasts and fungi pathogens and parasites plants insects humans and primates and bacteria with linear chromosomes Advances in the field as well as continuing challenges are discussed throughout The mosaic nature of this collection and the everchanging perspectives reflect the nature of subtelomeres themselves Unlike the core of most genomes which are conserved and stable over time subtelomeres are dynamic and polymorphic so much so that generally no two individuals look alike in these regions The dynamic nature of the region and the ability to change the copy number generate diversity and try novel combinations make it the evolutionary tinker s toolbox In many organisms the genes found in the region are involved in dealing with the environment In yeasts different gene families involved in sugar metabolism as well as clumping together are found in subtelomeres and differences in the region may be the reason why some strains are good for baking others for brewing and

why some are pathogenic In fungal plant and animal pathogens many of the genes involved in virulence are found here In humans and primates there are a number of gene families that vary between ends for example the diverse olfactory receptor genes Even in bacterial linear chromosomes the region contains genes involved in adapting to their environments Perhaps the ultimate use of these regions is in parasites where they rapidly adapt and escape from host immune systems through dynamic changes to the proteins exposed to the host s defenses Such dynamic polymorphic structures are also found in plants and insects though it is not always clear what the function might be in some cases they take on the role of end maintenance The dynamic polymorphic nature of subtelomeres where many ends share segmental duplications is an exciting area for study but also presents a difficult challenge from the technical perspective
