

## PROTEIN SYNTHESIS

### TRANSLATION

1. Translation is the process of synthesizing a protein from an mRNA template. The mRNA template is read in groups of three bases called codons. Each codon codes for a specific amino acid.

2. During translation, the ribosome moves along the mRNA template, reading the codons and adding the corresponding amino acids to the growing polypeptide chain.

3. The process continues until the ribosome reaches a stop codon, which signals the end of translation. The completed polypeptide chain is then released from the ribosome.

## THE GENETIC CODE

### "One codon at a time"

1. Biological systems use sequences of three nucleotides to specify the amino acids that are used to build proteins. These sequences are called codons.

2. Each codon codes for a specific amino acid, and the sequence of codons in an mRNA molecule determines the sequence of amino acids in a protein.

3. The genetic code is universal, meaning that the same codon codes for the same amino acid in all organisms. This allows for the transfer of genetic information between different species.

4. The genetic code is also redundant, meaning that multiple codons can code for the same amino acid.

### "One gene - one protein"

1. Each gene contains the instructions for building a specific protein. The sequence of nucleotides in a gene determines the sequence of codons in the mRNA molecule, which in turn determines the sequence of amino acids in the protein.

2. The relationship between a gene and a protein is one-to-one, meaning that each gene codes for a single protein.

Understanding the Impact of Gene mutation on Health & Diseases. An Overview. Dr. HAKIM, 2020-04-09 Each cell depends on thousands of proteins to do their jobs in the right places at the right times to function correctly Sometimes gene mutations prevent one or more of these proteins from working properly By changing a gene's instructions for making a protein a mutation can cause the protein to malfunction or to be missing entirely When a mutation alters a protein that plays a critical role in the body it can disrupt normal development or cause a medical condition A condition caused by mutations in one or more genes is called a genetic disorder In some cases gene mutations are so severe that they prevent an embryo from surviving until birth These changes occur in genes that are essential for development and often disrupt the development of an embryo in its earliest stages Because these mutations have very serious effects they are incompatible with life It is important to note that genes themselves do not cause disease genetic disorders are caused by mutations that make a gene function improperly For example when people say that someone has the cystic fibrosis gene they are usually referring to a mutated version of the CFTR gene which causes the disease All people including those without cystic fibrosis have a version of the CFTR gene An attempt has been made in this informative Booklet to summarize the fundamental topics related to genetic mutations and its impact on health and development along with several illustrations Dr H K Saboo M B Bom M R S H London *Department of Defense Chemical, Biological, Radiological, and Nuclear*

types providing valuable insights into tumor behavior and treatment outcomes there are still gaps in understanding their genetic mechanisms These genes are crucial in stratifying patients into different risk groups and are implicated in therapy resistance a significant challenge in cancer treatment Therefore a better investigation into the genetic mechanisms underlying these signature genes is needed to develop novel therapeutic interventions and strategies to overcome therapy resistance and improve patient responses

**Conditional Evolution of Life** José Tiberius, 2020-06-01 Analysis of Mendel Lamarck and Darwin s theory of evolution PDF book on modern and alternative theories of evolution General Theory of Conditional Evolution of Live and Synthetic theory Creationism vs evolution and Intelligent design Theories of human origin Every theory has a philosophical substratum including the experimental theories even the concept of perception is a usually studied by philosophers In a theory directly related to the concept of life this duality is more openly apparent Therefore it is advisable to have both points of view present so as not to mix them and let a different philosophic religious position affect the acceptance or rejection of the evolutionary theory s scientific content The ideas of the new theory of evolution or Evolutionary Biology orbit around the objectives of evolution such as the direct cause of changes in genetic information and the way in which these changes are passed on to descendants The new proposals are conceptually closer to Lamarck and Mendel s theories of evolution than to Darwin s theory The fundamental development in the General Theory of Conditional Evolution of Life is the concept of the evolution as an internal mechanism of improvement of living beings that transmits to descendants At the same time I can cite especially the evolutionary mechanism of sexual differentiation and the method of Verification of Genetic Information VGI as the new key on theory of evolution origin of life human evolution and intelligence evolution

The complex phenotype of Diabetic Cardiomyopathy: clinical indicators and novel treatment targets Ramoji Kosuru, Yin Cai, Priyanka Choudhury, 2024-10-09 Diabetic cardiomyopathy is a clinical condition of heart dysfunction that develops in the absence of hypertension and coronary atherosclerosis in diabetic patients The main characteristics of diabetic cardiomyopathy are myocardial fibrosis cardiac stiffness left ventricular hypertrophy and decreased left ventricular compliance This eventually progresses to clinical heart failure with reduced ejection fraction To detect changes in cardiac structure and function such as fibrosis several noninvasive techniques have been used These include echocardiography cinematic magnetic resonance imaging and computed tomography From a mechanistic perspective oxidative stress inflammation enhanced production and deposition of advanced glycation end products AGEs mitochondrial dysfunction impaired mitochondrial  $\text{Ca}^{2+}$  handling and function and endoplasmic reticulum stress are observed Furthermore activation of the sympathetic nervous system and renin angiotensin system microvascular dysfunction and cardiac metabolic disorders are involved in the pathophysiology of this condition Numerous proteins and signaling pathways such as AMPK FOXO1 SERCA2A NF  $\kappa$ B Nrf2 HO 1 MAPK PKC and PPARs may be implicated in the development of diabetic cardiomyopathy Additionally increased levels of O linked N acetylglucosamine O GlcNAc C reactive protein atrial natriuretic peptide and brain natriuretic peptide among others may also serve as clinical biomarkers to identify diabetic cardiomyopathy Lifestyle modifications including aerobic exercise maintaining a healthy weight and smoking cessation are beneficial treatment measures to avoid diabetic cardiomyopathy It is significant to note that in people with diabetes mellitus high blood glucose and systemic and cardiac insulin resistance are independently correlated to the development and progression of cardiac dysfunction and heart failure The prevalence of diabetic cardiomyopathy declines with sustained glycemic management However a formal definition for diabetic cardiomyopathy as a distinct clinical entity remains poorly defined due to a lack of accepted diagnostic criteria and knowledge of subclinical cardiovascular diseases at the early stages of diabetes mellitus There is currently no distinct histological features biochemical markers or clinical manifestation that can be used to make a

definitive diagnosis of diabetic cardiomyopathy. Additionally, there are no prospective clinical trials to back up the claim that high insulin or blood sugar levels alone, without additional risk factors like obesity, coronary heart disease, or high blood pressure, increase the likelihood of developing diabetic cardiomyopathy. To decipher the precise mechanisms behind the onset and progression of diabetic cardiomyopathy and to develop novel strategies for reducing the risk of heart failure in people with diabetes, further research is necessary. Hence, more clinical observational studies are required to comprehend the unknown factors underlying diabetic cardiomyopathy and to further investigate novel biomarkers that can be used for risk assessment, screening, and diagnosis. Early detection and early intervention are essential for preventing diabetic cardiomyopathy, which drives ongoing research to better understand and treat this condition.
