It is straightforward to find out if a proposed approximation,  $\hat{f}$ , is a good approximation to the true function  $f$ . One can use the following procedure: (1) Generate a large number of independent samples from the target distribution  $\pi$ . (2) Compute the sample mean and sample variance of the function  $f$  over these samples. (3) Compute the sample mean and sample variance of the function  $\hat{f}$  over these samples. (4) Compare the sample mean and sample variance of  $\hat{f}$  to the sample mean and sample variance of  $f$ . If the sample mean and sample variance of  $\hat{f}$  are close to the sample mean and sample variance of  $f$ , then  $\hat{f}$  is a good approximation to  $f$ . If the sample mean and sample variance of  $\hat{f}$  are far from the sample mean and sample variance of  $f$ , then  $\hat{f}$  is a poor approximation to  $f$ .
