Ravi P. Agarwal, Martin Bohner, Abdullah Özbekler, 2021-04-12 This book provides an extensive survey on Lyapunov type inequalities. It summarizes and puts order into a vast literature available on the subject and sketches recent developments in this topic. In an elegant and didactic way, this work presents the concepts underlying Lyapunov type inequalities, covering how they developed and what kind of problems they address. This survey starts by introducing basic applications of Lyapunov's inequalities. It then advances towards even order, odd order, and higher order boundary value problems. Lyapunov and Hartman type inequalities, systems of linear, nonlinear, and quasi-linear differential equations, recent developments in Lyapunov type inequalities, partial differential equations, linear difference equations, and Lyapunov type inequalities for linear, half-linear, and nonlinear dynamic equations on time scales, as well as linear Hamiltonian dynamic systems. Senior undergraduate students and graduate students of mathematics, engineering, and science will benefit most from this book, as well as researchers in the areas of ordinary differential equations, partial differential equations, difference equations, and dynamic equations. Some background in calculus, ordinary and partial differential equations, and difference equations is recommended for full enjoyment of the content.

Categorification in Geometry, Topology, and Physics Anna Beliakova, Aaron D. Lauda, 2017-02-21 The emergent mathematical philosophy of categorification is reshaping our view of modern mathematics by uncovering a hidden layer of structure in mathematics revealing richer and more robust structures capable of describing more complex phenomena Categorification is a powerful tool for relating various branches of mathematics and exploiting the commonalities between fields It provides a language emphasizing essential features and allowing precise relationships between vastly different fields This volume focuses on the role categorification plays in geometry topology and physics These articles illustrate many important trends for the field including geometric representation theory homotopical methods in link homology interactions between higher representation theory and gauge theory and double affine Hecke algebra approaches to link homology The companion volume Contemporary Mathematics Volume 683 is devoted to categorification and higher representation theory

Finite Volumes for Complex Applications X—Volume 2, Hyperbolic and Related Problems Emmanuel Franck, Jürgen Fuhrmann, Victor Michel-Dansac, Laurent Navoret, 2023-10-12 This volume comprises the second part of the proceedings of the 10th International Conference on Finite Volumes for Complex Applications FVCA held in Strasbourg France during October 30 to November 3, 2023 The Finite

Volume method and several of its variants is a spatial discretization technique for partial differential equations based on the fundamental physical principle of conservation. Recent decades have brought significant success in the theoretical understanding of the method. Many finite volume methods are also built to preserve some properties of the continuous equations including maximum principles, dissipativity, monotone decay of the free energy, asymptotic stability or stationary solutions. Due to these properties, finite volume methods belong to the wider class of compatible discretization methods which preserve qualitative properties of continuous problems at the discrete level. This structural approach to the discretization of partial differential equations becomes particularly important for multiphysics and multiscale applications. In recent years, the efficient implementation of these methods in numerical software packages more specifically to be used in supercomputers has drawn some attention.

The first volume contains all invited papers as well as the contributed papers focusing on finite volume schemes for elliptic and parabolic problems. They include structure preserving schemes, convergence proofs and error estimates for problems governed by elliptic and parabolic partial differential equations. This volume is focused on finite volume methods for hyperbolic and related problems such as methods compatible with the low Mach number limit or able to exactly preserve steady solutions, the development and analysis of high order methods or the discretization of kinetic equations.
