Name: _____

The Endocrine System

Introduction: Hormones are often referred to as "chemical messengers." These tiny messengers are created and released by one organ, and into the bloodstream, and regulate the activity of another organ or cell. For example, adrenaline is created and released by the **adrenal glands**. It is sent into the bloodstream and has impacts on many other organs in our body, such as the heart. Adrenaline can only get heart rate to increase in a stressful situation. The **ovarian glands** and **testes** are in completely different body systems, but thanks to hormones these organs can "communicate."

Many organs in the human body have **endocrine glands** and a smaller group of organs that make and release hormones into the bloodstream. These glands can be found throughout the body and collectively make up the **endocrine system**. In this activity, you will read about each endocrine gland, color it, and finally color which hormones it produces.

1. What is a hormone?
2. What is an example of a hormone?
3. Which type of glands make hormones?

Hypothalamus

If you've studied the nervous system, you are familiar with the hypothalamus, a part of the brain. The hypothalamus receives information from the brain and bloodstream on the conditions of the body. It responds to this information by creating hormones, which it then sends to the **pituitary gland**, which hangs from the hypothalamus. The pituitary gland either responds to or sends these hormones back to the hypothalamus.

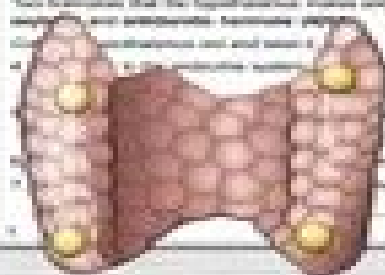

Two hormones that the hypothalamus makes and sends to the posterior pituitary gland are **oxytocin** and **antidiuretic hormone (ADH)**.

Color the hypothalamus and label it.

1. The **endocrine system** is the system where the hypothalamus "talking to"

2. Which hormone from the anterior pituitary triggers the adrenal cortex to produce hormones?

3. The **thyroid gland** is a butterfly-shaped gland in the neck. It produces **thyroxine** and **calcitonin**.

4. The **parathyroid glands** are four small glands located on the thyroid gland. They produce **parathyroid hormone (PTH)**.

Anatomy of the Endocrine System

1. The **hypothalamus** is located behind the brain and is part of the endocrine system. It is known as the **master gland** because it controls the activity of many other glands, the **pituitary gland**.

2. The **pituitary gland** is a small, pea-sized gland located below the hypothalamus. It is often called the "master gland" because it controls the activity of many other glands in the endocrine system.

3. The **thyroid gland** is a butterfly-shaped gland located in the neck. It produces the hormones **thyroxine** and **calcitonin**.

4. The **adrenal glands** are two glands, each sitting on top of a kidney. Each adrenal gland has two parts: the **adrenal cortex** (outer part) and the **adrenal medulla** (inner part).

5. The **testes** are two glands located in the male reproductive system. They produce the hormone **testosterone**.

6. The **ovaries** are two glands located in the female reproductive system. They produce the hormones **estrogen** and **progesterone**.

7. The **pancreas** is a gland located in the abdominal region. It produces the hormone **insulin**.

8. The **gonads** are the testes in males and the ovaries in females. They produce sex hormones.

9. The **endocrine system** is the system where the hypothalamus "talking to"

10. Which hormone from the anterior pituitary triggers the adrenal cortex to produce hormones?
