Electron microscopy is a technique used to study the structure of materials at the atomic level. It involves the use of a beam of electrons to illuminate a specimen, which is then captured by a detector. This technique is particularly useful for studying the structure of polymers, as it allows for the visualization of individual polymer chains and their interactions. In the context of the study, electron microscopy was used to investigate the structure of the polymer blends, showing that the polymer chains were well-dispersed and that there was no significant phase separation.
