

ENDOCRINE SYSTEM

Endocrine System: WORKING TOGETHER

Each organ system works on other systems within the body to do its "job". Our bodies learn just some of the ways that the endocrine system interacts with other organ systems.

Nervous System

Circulatory System

Endocrine System: FACTS

Endocrine System: PROBLEMS

Most of the time, the endocrine system works perfectly well. However, sometimes problems can arise.

Diabetes

Diabetes is a condition that causes high blood glucose (sugar) levels. It is caused by the body being unable to either produce or use the hormone insulin. So, the glucose in the blood gets stuck or "stuck". Symptoms include increased thirst, weight gain, changes in vision, frequent weight changes, persistent sores, numbness or tingling in the hands.

Endocrine System: KEY TERMS

Term	Definition
Endocrine System	Network of endocrine glands that make, store, and release hormones.
Hormones	Chemical messengers that carry information and instructions from one cell to another.

Endocrine System: HORMONES

Hormones are chemical signals. Hormones are released by a gland and travel in the blood to a receptor. The receptor then sends a message to the target cell to do a specific action. Hormones are released by the endocrine system. The endocrine system is made up of glands that release hormones.

Endocrine System: FIGHT-OR-FLIGHT

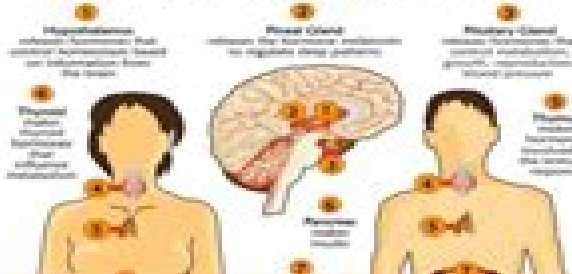

The fight-or-flight response is a reaction that occurs in the body when we are really frightened. The body's fight-or-flight response is the body's way of reacting to a dangerous situation. When we are scared, our body releases hormones that make us feel like we are in danger. These hormones make us feel like we are in danger and make us feel like we are in danger.

When we are scared, our body releases hormones that make us feel like we are in danger. These hormones make us feel like we are in danger and make us feel like we are in danger.

Endocrine System: GLANDS

A gland is a structure that produces and releases substances that perform a specific function in the body. There are many glands in the body. Some glands are endocrine glands, which release hormones into the bloodstream. Other glands are exocrine glands, which release substances into the body through a duct. Endocrine glands include the thyroid, pituitary, and adrenal glands.

Endocrine System: FEEDBACK LOOPS

Endocrine systems are regulated by complex feedback loops. These feedback loops help the body maintain balance. When a hormone level is too high or too low, the body releases a signal to the glands to produce more or less of that hormone. This signal is called a feedback loop.

The glands respond to the feedback loop by releasing more or less of the hormone. This helps the body maintain balance. When a hormone level is too high or too low, the body releases a signal to the glands to produce more or less of that hormone.
