Identifying and Controlling Immunotoxic Substances, 1991 OECD Guidelines for the Testing of Chemicals, Section 4 Test No. 495: Ros (Reactive Oxygen Species) Assay for Photoreactivity OECD, 2019-06-18 Phototoxicity is defined as a toxic response is elicited by topically or systemically administered photoreactive chemicals after the exposure of the body to environmental light Several classes of photoreactive chemicals could cause phototoxic reactions when activated by light at otherwise non toxic doses Phototoxicity can be categorized as photoirritation photoallergy and photogenotoxicity The purpose of this test is to measure the phototoxicity of a chemical The main event in any phototoxic reaction is the absorption of photons of a wavelength that induces the excitation of the chromophore Excitation energy is often transferred to oxygen molecules followed by the generation of ROS reactive Oxygen Species Measurements are performed using a spectrometer The determination of the ROS generation from irradiated chemicals with simulated sunlight is indicative of phototoxic potential

Short-Term Test Systems for Detecting Carcinogens K.H. Norpoth,2012-12-06 The varying cancer incidence from country to country and region to region suggests that environmental factors play a considerable role in the aetiology of cancer Whether these factors in the environment moderate the effect of carcinogenic chemicals or whether they might themselves be carcinogenic is not known at the present time What is known is that there are various chemicals both naturally occurring and man made which can induce cancer in man In the Western world estimates vary as to how much cancer is occupational in origin the figures range from 1% to 40% It is our feeling that probably about 10% of cancer has a direct occupational origin Nevertheless this number is considerable and it behoves us therefore to identify those chemicals which are carcinogenic and to reduce human exposure Recent work on the mode of action of carcinogenic chemicals suggests that the majority exert their effect through an activation step to give electrophilic metabolites Such metabolites have as a common feature the ability to react with cellular nucleophiles to give covalently bound products Such reaction will occur after carcinogen treatment of animals with nucleic acids particularly in target organs It is reaction with nucleic acids that provides the basis of a number of short term tests for carcinogens since the basic composition of DNA is similar in micro organisms and in human cells
