

Wiring Two Keypads to Control a Single Door

The diagram above shows how to connect two keypads to control a single door. Entering your code on keypad 2 unlocks the magnet's directly. When you enter your code on keypad 1, it triggers the REL input of keypad two, which unlocks the door.

Please note that your codes must be programmed into both keypads.

TECHNICAL NOTES

This product was re-designed using a new manufacturing technology, which changed the physical appearance of the keypad electronics. The LED's changed to surface mount chip-LED's mounted on bottom of the circuit board which eliminates the need for the wire harnesses. It is also possible to control the red and green chip-LED's externally, with an alarm panel for example, by using connector J1. See the diagram for details. Also, the voltage selection jumper on the main circuit board is no longer required.

To prevent electrical lock back voltage from damaging the keypad, when using an electrical locking device, you MUST install the transistors as close as possible to the lock. Wire the transistors in parallel with the lock power terminals.

Also, to avoid ESD (electro-static discharge) from interfering with the operation of the keypad, ground the negative terminal of the keypad to earth ground. If you cannot ground the power supply, then you must ground the keypad housing.

IEI recommends using a filtered and regulated power supply.
