Dependable Computing for Critical Applications 3 Carl E. Landwehr, Brian Randell, Luca Simoncini, 2013-06-29 This

volume contains the papers presented at the Third IFIP International Working Conference on Dependable Computing for Critical Applications sponsored by IFIP Working Group 10.4 and held in Mondello Sicily Italy on September 14-16 1992. System developers increasingly apply computers where they can affect the safety and security of people and equipment. The Third IFIP International Working Conference on Dependable Computing for Critical Applications like its predecessors addressed various aspects of computer system dependability a broad term defined as the degree of trust that may justifiably be placed in a system's reliability availability safety security and performance. Because the scope of the conference was so broad we hope the presentations and discussions will contribute to the integration of these concepts so that future computer based systems will indeed be more dependable. The Program Committee selected 18 papers for presentation from a total of 74 submissions at a May meeting in Newcastle upon Tyne UK. The resulting program represented a broad spectrum of interests with papers from universities corporations and government agencies in eight countries. Much diligent work by the Program Committee and the quality of reviews from more than a hundred external referees from around the world for which we are most grateful significantly eased the production of this technical program.

13th National Computer Security Conference, 1990. *Dependable Embedded Systems* Jörg Henkel, Nikil Dutt, 2020-12-09. This Open Access book introduces readers to many new techniques for enhancing and optimizing reliability in embedded systems which have emerged particularly within the last five years. This book introduces the most prominent reliability concerns from today's points of view and roughly recapitulates the progress in the community so far. Unlike other books that focus on a single abstraction level such as circuit level or system level alone the focus of this book is to deal with the different reliability challenges across different levels starting from the physical level all the way to the system level cross layer approaches. The book aims at demonstrating how new hardware software co design solution can be proposed to effectively mitigate reliability degradation such as transistor aging processor variation temperature effects soft errors etc. Provides readers with latest insights into novel cross layer methods and models with respect to dependability of embedded systems. Describes cross layer approaches that can leverage reliability through techniques that are proactively designed with respect to techniques at other layers. Explains run time adaptation and concepts means of self organization in order to achieve error resiliency in complex future many core systems.

Real Time Programming 1983 G. M. Bull, 2016-06-06. Real Time Programming 1983 contains the proceedings of the 12th IFAC IFIP Workshop held at Hatfield UK on March 29-31 1983. The book organizes the papers of the workshop into four categories: Programming Support Environments Testing Real Time Programs Databases for Real Time Systems and Languages and Language Implementations. The papers on Programming Support Environments category cover application oriented requirements specifications configuration control and design description languages of real time programming. Papers on Databases for Real Time Systems category talk about wide range of aspects of the problem in the system. Five papers on Testing Real Time Programs category show importance of structure in producing software principles.

in testing and reliability issues use of separate computer for measuring and tracing real time software set of tools and methods for testing real time software and set of debugging facilities incorporated into the language Modula The Languages and Language Implementations category explains the exception handling mechanisms provided by languages performance of the run time support to task management in ADA and implementation of multi tasking and inter task message passing for Industrial Real Time Basic

Dependable Computing for Critical Applications Algirdas Avizienis, Jean-Claude Laprie, 2012-12-06 The International Working Conference on Dependable Computing for Critical Applications was the first conference organized by IFIP Working Group 10.4 Dependable Computing and Fault Tolerance in cooperation with the Technical Committee on Fault Tolerant Computing of the IEEE Computer Society and the Technical Committee 7 on Systems Reliability Safety and Security of EWICS The rationale for the Working Conference is best expressed by the aims of WG 10.4 Increasingly individuals and organizations are developing or procuring sophisticated computing systems on whose services they need to place great reliance In differing circumstances the focus will be on differing properties of such services e.g. continuity performance real time response ability to avoid catastrophic failures prevention of deliberate privacy intrusions The notion of dependability defined as that property of a computing system which allows reliance to be justifiably placed on the service it delivers enables these various concerns to be subsumed within a single conceptual framework Dependability thus includes as special cases such attributes as reliability availability safety security The Working Group is aimed at identifying and integrating approaches methods and techniques for specifying designing building assessing validating operating and maintaining computer systems which should exhibit some or all of these attributes The concept of WG 10.4 was formulated during the IFIP Working Conference on Reliable Computing and Fault Tolerance on September 27-29 1979 in London England held in conjunction with the Europ IFIP 79 Conference Profs A.
