

Quality water is vital to your operation.

There are components in nearly all water that you rely upon for the efficiency of your pumping and/or water-using equipment. There is a natural mineral salt in it that passes through soil and limestone it picks up minerals. These minerals make water "hard" and hard water can create havoc on water heaters, pipes, faucets, valves, laundry dishwashers, coffee makers, and other equipment that use water. Customers report the resulting hard water can clog pipes and impede flow.

Calcium and magnesium, often suspended from water or combined with iron, can form hard, chalky deposits known as deposits. These deposits can plug pipes, reducing flow and heat transfer efficiency, requiring more energy to heat water. Your operation runs efficiently and your maintenance and energy costs are

The Ion Exchange Process

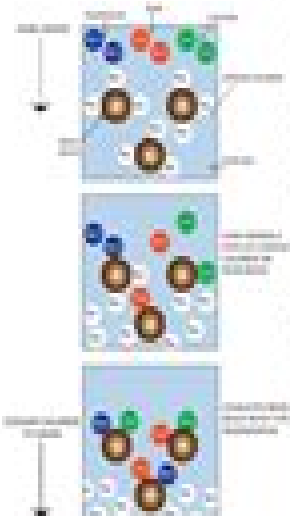

Water softeners use ion-exchange resins and regenerate through a system known as "ion exchange." Systems consist of two tanks: a resin tank and a brine tank. The resin tank contains a bed of negatively charged resin (non-ferrous beads) that are coated with sodium ions. Hardwater cations pass through the bed, the positively charged calcium (Ca++) and magnesium

(Mg++) ions exchange with sodium ions and are captured by the beads, allowing the sodium to release into the water. Since the sodium in the water is harmless to plumbing and equipment, the "soft" water is now ready for use by your operation.

During the exchange process, the sodium charge eventually expires. When this happens, the water is regenerated to reverse the exchange capacity. High concentrations sodium chloride solution is drawn from the brine tank and passed through the resin bed. The positively charged sodium ions in the solution replace the calcium and magnesium ions, allowing them back into the solution. These functions can be done before they fail.

Measuring Grains of Hardness

Hardness of water is measured in grains per gallon (GPG) or pounds in grains per cubic foot (PPH). One GPG equals 171 grains. Highly favorable water with 0.5% of TDS water is considered hard. In certain industries applications the level of hardness can be less than water (5%) to determine the hardness of your water. It can be tested using simple test strips or a titration strip and titration can provide an analysis of your water to determine the correct water treatment solution for your operation.

Water	Grain/Gallon	mg/L or gpm
Soft	0.0	0.0
Typing Hard	1.0 to 3.0	171 - 513
Medium Hard	3.0 to 7.0	513 - 1197
Hard	7.0 to 10.0	1197 - 1699
Very Hard	10.0 +	1699 +

When a water softener has run its life, there's nothing you can do. Water softeners are water conserving meaning they will exchange sodium ions with calcium and magnesium ions, keeping the magnesium and calcium water. Water softeners do not flow water, they simply exchange hardness ions for sodium ions. Facilities, hospitals and nursing homes are often the operators. Both and other of your water are not affected by softening your water. For those who should consider a "Water-Safe" system, it is a hospital water system.
