Genetics Joins Evolutionary Theory

Genetics Joins Evolutionary Theory

Genetics's impact on evolution transformed evolutionary theory.

- 1. Mendel's experiments showed that traits are controlled by genes and that genes segregate independently from one another. This established different alleles in an individual (heterozygous) formed combinations of offspring (genotypes).
- 2. Genetic composition varies among related populations. Alleles of a population form a gene pool (group of genes, called alleles).
- 3. **Allele frequency** is the number of alleles an allele occupies in a gene pool. **Allele frequency** is the number of alleles for the trait (gene) under the genetic pool, divided by the total number of alleles for that population.

Discovery of Genetic Variation Darwin's view evolved genetic composition over time, genetic composition varied populations, and local populations.

- 1. Variation is any change in composition of DNA.
- 2. Gene frequency differs from one population to another due to genetic drift, migration, and mutation. The genetic drift results in random fluctuations in allele frequencies. Genetic drift is most pronounced in very small populations or in those with bottlenecks or founder effects.
- 3. Environmental factors (temperature) of genes that also represent phenotypic adaptation (traits) and the resulting phenotypic variation.

Single Gene and Polygenic Traits Mendel's inheritance patterns phenotypes are simple Mendelian or dominant gene, recessive gene.

- 1. **Single gene trait** is controlled by one gene. An example is single inheritance patterns of traits, Mendel's pea plants.
- 2. **Polyploid trait** is controlled by more than one gene, and the typical allele has more than one allele. An example of a **polyploid trait** is height.

Genetics Joins Evolutionary Theory

The questions 1-4, complete each statement by writing the correct word or phrase.

- 1. Mendel's experiments made major contributions to Genetics which that led to Evolution.
- 2. An allele is a variant form of a gene, including the version for each particular gene, produced by recombination.
- 3. A gene pool typically contains different alleles for each trait in a population.
- 4. The number of alleles that occupy a gene, the gene pool, composed with the number of chromosomes in the cell but the gene pool is a finite allele frequency within population.
