### TESTING BATTERY ELECTROLYTE (ACID)

A hydrometer should be used to determine the specific gravity of battery electrolyte. The reading obtained indicates amount of unused sulphuric acid remaining in electrolyte and state of charge of battery.

The reading obtained will vary in relation to the temperature of the electrolyte. As the temperature rises the density of the electrolyte decreases and the specific gravity falls. As the temperature falls the density increases and the specific gravity rises.

### USING THE HYDROMETER

1. Liquid level of battery cell should be at normal height and electrolyte should be thoroughly mixed with any battery water which may have just been added by charging battery before taking hydrometer readings.
2. Draw electrolyte in and out of hydrometer barrel several times to bring temperature of hydrometer float to that of the acid in the cell.

3. Draw sufficient electrolyte into hydrometer barrel with the pressure bulb fully expanded to lift float so that it does not touch the sides, bottom or top of barrel.
4. Read the hydrometer with the hydrometer in a vertical position.

### TEST RESULT INDICATIONS

Electrolyte specific gravity	Battery Charge Level
1.240 to 1.260	100%
1.210 to 1.240	75%
1.180 to 1.210	50%
Below 1.130	Completely discharged.

A battery should be charged if the specific gravity is less than 1.210.

If there is more than 0.25 specific gravity variation between cells then a fault is most likely with the battery itself.

If battery charge is low and battery is serviceable, check alternator operation and all electrical connections.

### BATTERY CHARGING

**WARNING:** When batteries are being charged explosive gas mixture forms beneath the cover of each cell.

- \* Do not smoke near batteries on charge or which have recently been charged.
- \* Do not break live circuit at terminals of batteries on charge.
